#### 1 Introduction

With the introduction of Jonathan Kew's  $X_{\overline{1}}T_{\overline{E}}X$ , users can now easily access system-wide fonts directly in a  $T_{\overline{E}}X$  variant, providing a best of both worlds environment.  $X_{\overline{1}}T_{\overline{E}}X$  eliminates the need for all those files required for installing fonts (.tfm, .vf, .map,...) and provides an easy way to select fonts in Plain  $T_{\overline{E}}X$ : \font\tenrm="Times New Roman" at 10pt.

However, it was still necessary to write cumbersome font definition files for LATEX, since the NFSS had a lot more going on behind the scenes to allow easy commands like \emph or \bfseries.

This package almost entirely eliminates this need by providing a completely automatic way to select font families in L<sup>A</sup>T<sub>E</sub>X for arbitrary fonts. Furthermore, it allows (again, almost) total control over the selection of rich font features such as number case and fancy ligatures (and many more!) present in most modern fonts.

## 1.1 Usage

For basic use, no package options are required:

\usepackage{fontspec}% provides font selecting commands
\usepackage{xunicode}% provides unicode character macros

Ross Moore's xunicode package is highly recommended, as it provides access LaTeX's various methods for accessing extra characters and accents (for example, \%, \\$, \textbullet, \"u, and so on), plus many more unicode characters.

The babel package is not really supported! Especially Vietnamese, Greek, and Hebrew at least will all not work correctly, as far as I can tell. Cyrillic and Latinbased languages, however, should at least be supported.

#### 1.1.1 Configuration

If you wish to customise any part of the fontspec interface (see later in this manual, Section 7 on page 22 and Section 7.1), this should be done by creating your own fontspec.cfg file, which will be automatically loaded if it is found by  $X_{\overline{1}}T_{\overline{2}}X$ . Either place it in the same folder as the main document for isolated cases, or in a location that  $X_{\overline{1}}T_{\overline{2}}X$  searches by default, e.g.,  $\sim$ /Library/texmf/xelatex/. The package option [noconfig] will suppress this behaviour under all circumstances.

#### 1.1.2 Warnings

This package can give many warnings that can be harmless if you know what you're doing. Use the [quiet] package option to write these warnings to the transcript (.log) file instead.

http://scripts.sil.org/xetex

<sup>&</sup>lt;sup>2</sup>An example is distributed with the package.

## 1.2 Warning

I still consider this package to be experimental, so I'm not ensuring backwards compatibility at all costs. I don't want to weigh the package down with old ways of doing things, so unfortunately this will mean that some old documents will need to be modified in order to compile correctly after future updates. It'll be worth it in the long run, but you can curse at my lack of foresight as much as you wish in the meantime.

 $(\rightarrow v1.6: An example warning!)$ 

Such things, and some other comments, are noted in the margin like this  $(\leftarrow)$ , with a red arrow if the change is relevant to the current release of the package.

#### 1.3 About this manual

This document has been typeset with X<sub>H</sub>T<sub>E</sub>X using a variety of fonts to display various features that the package supports. You will not be able to typeset the documentation if you do not have all of these fonts, although I've used as many Mac OS X pre-installed fonts as possible. Running normal LaT<sub>E</sub>X (*i.e.*, without X<sub>H</sub>T<sub>E</sub>X) on this file will generate the fontspec.sty file if this is required for some odd reason.

Many examples are shown in this manual. These are typeset side-by-side with their verbatim source code, although various size-altering commands (\large, \Huge, etc.) are omitted for clarity. Since the package supports font features for both AAT and OpenType fonts (whose feature sets only overlap to some extent), examples are distinguished by colour: blue and red, respectively. Examples whose font type is irrelevant are typeset in green.

## 2 Brief overview

This manual can get rather in-depth, as there are a lot of font features to cover. A basic preamble set-up is shown below, to simply select some default document fonts. See the file fontspec-example.tex for a more detailed example.

\usepackage{fontspec}
\defaultfontfeatures{Scale=MatchLowercase}
\setromanfont[Mapping=tex-text]{Baskerville}
\setsansfont[Mapping=tex-text]{Skia}
\setmonofont{Courier}

#### 3 Font selection

\fontspec

As our first example, look how easy it is to select the Hoefler Text typeface with the fontspec package:

\def\pangram{The five boxing The five boxing wizards jump quickly. wizards jump quickly.\\} The five boxing wizards jump quickly. \fontspec{Hoefler Text} \pangram The five boxing wizards jump quickly. { \itshape \pangram The five boxing wizards jump quickly. { \scshape \pangram } The five boxing wizards jump quickly. { \scshape\itshape \pangram The five boxing wizards jump quickly. \bfseries \pangram { \itshape \pangram THE FIVE BOXING WIZARDS JUMP QUICKLY. { \scshape \pangram THE FIVE BOXING WIZARDS JUMP QUICKLY. { \itshape\scshape \pangram

The fontspec package takes care of the necessary font definitions for those shapes as shown above *automatically*. Furthermore, it is not necessary to install the font for X<sub>\begin{align\*}TEX\end{align\*} in any way whatsoever: every font that is installed in the operating system may be accessed.</sub>

## 3.1 Font instances for efficiency

For cases when a specific font with a specific feature set is going to be re-used many times in a document, it is inefficient to keep calling \fontspec for every use. While the command does not define a new font instance after the first call, the feature options must still be parsed and processed.

\newfontinstance

For this reason, *instances* of a font may be created with the \newfontinstance command, as shown in the following example:

FONT INSTANCES FOR EFFICIENCY

\newfontinstance\secfont[Letters=SmallCaps]{Hoefler Text}
\secfont Font instances for efficiency

## 3.2 Default font families

\setromanfont \setsansfont \setmonofont The \setromanfont, \setsansfont, and \setmonofont commands are used to select the default font families for the entire document. They take the same arguments as \fontspec. For example:

Pack my box with five dozen liquor jugs.

Pack my box with five dozen liquor jugs.

Pack my box with five dozen liquor jugs.

Here, the scales of the fonts have been chosen to equalise their lowercase letter heights. The Scale font feature will be discussed further in Section 5 on page 8, including methods for automatic scaling.

## 3.3 Arbitrary bold/italic/small caps fonts

The automatic bold, italic, and bold italic font selections will not be adequate for the needs of every font: while some fonts mayn't even have bold or italic shapes, in which case a skilled (or lucky) designer may be able to chose well-matching (→ v1.6: These options used to be called Bold and Italic, and these shorter names may still be used if you desire.) accompanying shapes from a different font altogether, others can have a range of bold and italic fonts to chose between. The BoldFont and ItalicFont options ( $\leftarrow$ ) are provided for these situations. If only one of these is used, the bold italic font is requested as the default from the new font.

```
\fontspec[BoldFont={Helvetica Neue}]
Helvetica Neue UltraLight
Helvetica Neue UltraLight | Helvetica Neue UltraLight | \\
Helvetica Neue UltraLight | Italic | \\
Helvetica Neue Italic | Helvetica Neue UltraLight | \\
Helvetica Neue Italic | \\
```

(→ v1.6: Yes, BoldItalic also works)

If a bold italic shape is not defined, or you want to specify *both* custom bold and italic shapes, the BoldItalicFont option is provided ( $\leftarrow$ ).

For those cases that the base font name is repeated, you can replace it with an asterisk (first character only). For example, some space can be saved instead of writing 'Baskerville SemiBold':

Baskerville *Italic* **SemiBold** *Italic* 

```
\fontspec[BoldFont={* SemiBold}]{Baskerville}
     Baskerville \textit{Italic}
\bfseries SemiBold \textit{Italic}
```

Old-fashioned font families used to distribute their small caps glyphs in separate fonts due to the limitations on the number of glyphs allowed in the PostScript Type 1 format. Such fonts may be used by declaring the SmallCapsFont of the family you are specifying:

#### 3.4 Math(s) fonts

When \setromanfont, \setsansfont and \setmonofont are used in the preamble, they also define the fonts to be used in maths mode inside the \mathrm-type commands. This only occurs in the preamble because LATEX freezes the maths fonts after this stage of the processing. The fontspec package must also be loaded after any maths font packages (e.g., euler) to be successful. (Actually, it is only euler that is the problem.)

\setmathrm
\setboldmathrm
\setmathsf
\setmathtt

However, the default text fonts may not necessarily be the ones you wish to use when typesetting maths (especially with the use of fancy ligatures and so on). For this reason, you may optionally use those commands listed in the margin (in the same way as our other \fontspec-like commands) to explicitly state which fonts to use inside such commands as \mathrm. Additionally, the \setboldmathrm command allows you define the font used for \mathrm when in bold maths mode (which is activated with, among others, \boldmath).

For example, if you were using Optima with the Euler maths font, you might have this in your preamble:

```
\usepackage[mathcal]{euler}
\usepackage{fontspec,xunicode}
\setromanfont{Optima Regular}
\setmathrm{Optima}
\setboldmathrm[BoldFont=Optima ExtraBlack]{Optima Bold}
```

and this would allow you to typeset something like this:

## 3.5 Miscellaneous font selecting details

By the way, from v1.9, \fontspec and \addfontfeatures will now ignore following spaces as if it were a 'naked' control sequence; e.g., 'M. \fontspec{...} N' and 'M. \fontspec{...}N' are the same.

Note that this package redefines the \itshape and \scshape commands in order to allow them to select italic small caps in conjunction. (This was implicitly shown in the first example, but it's worth mentioning now, too.)

In previous versions of X<sub>H</sub>T<sub>E</sub>X, nesting of LaT<sub>E</sub>X's emphasis font switching was broken. To make it more reliable, fontspec overrides it anyway, and copies a feature from the fixltx2e package: \eminnershape defines how nested emphasis should look:

```
\renewcommand\eminnershape{\scshape}\
Nested emphasis is Now fixed.
\fontspec{Didot}\
Nested {\em emphasis is \emph{now} fixed.}
```

## 4 Selecting font features

The commands discussed so far each take an optional argument for accessing the font features of the requested font. These features are generally unavailable or harder to access in regular LATEX. The font features and their options are described in Section 6 on page 11, but before we look at the range of available font features, it is necessary to discuss how they can be applied.

#### 4.1 Default settings

\defaultfontfeatures

It is desirable to define options that are applied to every subsequent font selection command: a default feature set, so to speak. This may be defined with the \defaultfontfeatures{\font features\}} command. New calls of \defaultfontfeatures overwrite previous ones.

## 4.2 Changing the currently selected features

\addfontfeatures

The \addfontfeatures \{\( \) font \( features \) \} command allows font features to be changed without knowing what features are currently selected or even what font is being used. A good example of this could be to add a hook to all tabular material to use monospaced numbers, as shown in the following example:

'In 1842, 999 people sailed 97 miles in 13 boats. In 1923, 111 people sailed 54 miles in 56 boats.'

Year	People	Miles	Boats	
1842	999	75	13	
1923	111	54	56	

```
13 boats. In 1923, 111 people sailed 54 miles in 56 boats.' \bigskip \addfontfeatures{Numbers={Monospaced,Lining}} \begin{tabular}{@{} cccc @{}} \toprule Year & People & Miles & Boats \\ \midrule 1842 & 999 & 75 & 13 \\ 1923 & 111 & 54 & 56 \\ \bottomrule
```

\fontspec[Numbers=0ldStyle]{Skia} `In 1842, 999 people sailed 97 miles in

\addfontfeature

This command may also be executed under the alias \addfontfeature.

\end{tabular}

## 4.3 Priority of feature selection

Features defined with \addfontfeatures override features specified by \fontspec, which in turn override features specified by \defaultfontfeatures. If in doubt, whenever a new font is chosen for the first time, an entry is made in the transcript (.log) file displaying the font name and the features requested.

### 4.4 Different features for different font shapes

It is entirely possible that separate fonts in a family will require separate options; *e.g.*, Hoefler Text Italic contains various swash feature options that are completely unavailable in the upright shapes.

The font features defined at the top level of the optional \fontspec argument are applied to *all* shapes of the family. Using Upright-, SmallCaps-, Bold-, Italic-, and BoldItalicFeatures, separate font features may be defined to their respective shapes *in addition* to, and with precedence over, the 'global' font features.

ATTENTION ALL MARTINI DRINKERS
ATTENTION ALL MARTINI DRINKERS

```
\fontspec{Hoefler Text} \itshape \scshape
Attention All Martini Drinkers \\
\addfontfeature{ItalicFeatures={Alternate = 1}}
Attention All Martini Drinkers \\
```

Combined with the options for selecting arbitrary *fonts* for the different shapes, these separate feature options allow the selection of arbitrary weights in the Skia typeface, for example:

```
Skia 'Bold'
```

\fontspec[BoldFont={Skia},
BoldFeatures={Weight=2}]{Skia}
Skia \\ \bfseries Skia `Bold'

Note that because most fonts include their small caps glyphs within the main font, these features are applied *in addition* to any other shape-specific features as defined above, and hence SmallCapsFeatures can be nested within ItalicFeatures and friends. Every combination of upright, italic, bold and small caps can thus be assigned individual features, as shown in the following ludicrous example.

Upright SMALL CAPS

Italic ITALIC SMALL CAPS

Bold BOLD SMALL CAPS

Bold Italic BOLD ITALIC SMALL

CAPS

## 5 Font independent options

Features introduced in this section may be used with any font.

#### 5.1 Scale

In its explicit form, Scale takes a single numeric argument for linearly scaling the font, as demonstrated in Section 3.2 on page 4. Since version 0.99 of X<sub>H</sub>T<sub>E</sub>X, however, it is now possible to measure the correct dimensions of the fonts loaded, and hence calculate values to scale them automatically.

(→ v1.9: As of Dec. 2005)

The Scale feature now  $(\leftarrow)$  also takes the options MatchLowercase and MatchUppercase, which will scale the font being selected to match the current default roman font to either the height of the lowercase or uppercase letters, respectively.

The perfect match is hard to find. LOGOFONT

```
\setromanfont{Georgia}
\newfontinstance\lc[Scale=MatchLowercase]{Verdana}
The perfect match {\lc is hard to find.}\\
\newfontinstance\uc[Scale=MatchUppercase]{Arial}
L 0 G 0 \uc F 0 N T
```

The amount of scaling used in each instance is reported in the .log file. Since there is some subjectivity about the exact scaling to be used, these values should be used to fine-tune the results.

## 5.2 Mapping

Mapping enables a X<sub>H</sub>T<sub>E</sub>X text-mapping scheme.

```
"¡A small amount of—text!" \fontspec[Mapping=tex-text]{Cochin}
\[ ``!`A small amount of---text!''
```

#### 5.3 Colour

Colour (or Color), also shown in Section 4.1 on page 6 and Section 6 on page 11, uses X<sub>H</sub>T<sub>E</sub>X font specifications to set the colour of the text. The colour is defined as a triplet of two-digit Hex RGB values, with optionally another value for the transparency (where 00 is completely transparent and FF is opaque.)

\fontsize{48}{48} \fontspec{Hoefler Text Black} {\addfontfeature{Color=FF000099}W}\kern-1ex {\addfontfeature{Color=0000FF99}S}\kern-0.8ex {\addfontfeature{Color=DDBB2299}P}\kern-0.8ex {\addfontfeature{Color=00BB3399}R}

## 5.4 Interword space

While the space between words can be varied on an individual basis with the TEX primitive \spaceskip command, it is more convenient to specify this information when the font is first defined.

The space in between words in a paragraph will be chosen automatically by X<sub>H</sub>T<sub>E</sub>X, and generally will not need to be adjusted. For those times when the precise details are important, the WordSpace features is provided, which takes either a single scaling factor to scale the value that X<sub>H</sub>T<sub>E</sub>X has already chosen, or a triplet of comma-separated values for the nominal value, the stretch, and the shrink of the interword space, respectively. *I.e.*, WordSpace=0.8 is the same as WordSpace={0.8,0.8,0.8}.

For example, I believe that the Cochin font, as distributed with Mac OS X, is too widely spaced. Now, this can be rectified, as shown below.

Some filler text for our example to take up some space, and to demonstrate the large default interword space in *Cochin*.

\fontspec{Cochin} \fillertext \vspace{1em}

Some filler text for our example to take up some space, and to demonstrate the large default interword space in *Cochin*.

 $\label{localization} $$ \fontspec[ WordSpace = \{0.7 , 0.8 , 0.9\} ]{Cochin} $$ fillertext $$$ 

Be careful with the unpredictable things that the AAT font renderer can do with the text! Unlike TEX, Mac OS X will allow fonts to letterspace themselves, which can be seen above; OpenType fonts, however, will not show this tendency, as they do not support this arguably dubious feature.

**Beware!** A font at a single scaling can only have a single set of interword space values, regardless of additional fontspec features. To obtain, say, two Cochin fonts with different amounts of interword space, it would be necessary to scale the second by a negligible amount, as in Scale=0.9999.

#### 5.5 Post-punctuation space

If \frenchspacing is *not* in effect, TEX will allow extra space after some punctuation in its goal of justifying the lines of text. Generally, this is considered old-

fashioned, but occasionally in small amounts the effect can be justified, pardon the pun.

The PunctuationSpace feature takes a scaling factor by which to adjust the nominal value chosen for the font. Note that PunctuationSpace=0 is *not* equivalent to \frenchspacing, although the difference will only be apparent when a line of text is under-full.

Letters, Words. Sentences. Letters, Words. Sentences. Letters, Words. Sentences. \nonfrenchspacing
\fontspec{Baskerville}
Letters, Words. Sentences. \par
\fontspec[PunctuationSpace=0.5]{Baskerville}
Letters, Words. Sentences. \par
\fontspec[PunctuationSpace=0]{Baskerville}
Letters, Words. Sentences.

Also be aware that the above caveat for interword space also applies here, so after the last line in the above example, the PunctuationSpace for *all* Baskerville instances will be 0.

## 5.6 Letter spacing

Letter spacing, or tracking, is the term given to adding (or subtracting) a small amount of horizontal space in between adjacent characters. It is specified with the LetterSpace, which takes a numeric argument.

That the letter spacing parameter is a normalised additive factor (not a scaling factor); it is defined as a percentage of the font size. That is, for a 10 pt font, a letter spacing parameter of '1.0' will add 0.1 pt between each letter.

USE TRACKING FOR DISPLAY CAPS TEXT USE TRACKING FOR DISPLAY CAPS TEXT

\fontspec{Didot}
\addfontfeature{LetterSpace=0.0}
USE TRACKING FOR DISPLAY CAPS TEXT \\
\addfontfeature{LetterSpace=2.0}
USE TRACKING FOR DISPLAY CAPS TEXT

This functionality *should not be used for lowercase text*, which is spacing correctly to begin with, but it can be very useful, in small amounts, when setting small caps or all caps titles. Also see the OpenType Uppercase option of the Letters feature (Section 6.4 on page 13).

#### 5.7 The hyphenation character

The letter used for hyphenation may be chosen with the HyphenChar feature. It takes three types of input, which are chosen according to some simple rules. If the input is the string None, then hyphenation is suppressed for this font. If the input is a single character, then this character is used. Finally, if the input is longer than a single character it must be the UTF-8 slot number of the hyphen character you desire.

Below, Adobe Garamond Pro's uppercase hyphenation character<sup>3</sup> is used to demonstrate a possible use for this feature. The second example redundantly

<sup>&</sup>lt;sup>3</sup>I found the character, and its number, in Mac OS X's Character Palette.

demonstrates the default behaviour of using the hyphen as the hyphenation character.

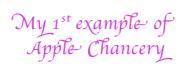

MULTITUDE OF **OBSTREPEROUSLY** HYPHENATED ENTITIES \def\text {A MULTITUDE OF OBSTREPEROUSLY HYPHENATED ENTITIES MULTITUDE OF OB-\par\vspace{1ex}} STREPEROUSLY HYPHENATED \fontspec[HyphenChar=None]{Adobe Garamond Pro} \text **ENTITIES** \fontspec[HyphenChar={-}]{Adobe Garamond Pro} \text MULTITUDE OF OB- $\label{lem:continuous} $$ \end{are} $$ \operatorname{Garamond Pro} \ \text{text} $$$ STREPEROUSLY HYPHENATED **ENTITIES** 

Note that in an actual situation, the Uppercase option of the Letters feature would probably supply this for you (see Section 6.4 on page 13).

The xelatex package redefines LaTeX's \- macro such that it adjusts along with the above changes.

## 6 Font-dependent features

This section covers each and every font feature catered for by this package. Some, in fact, have already be seen in previous sections. There are too many to list in this introduction, but for a first taste of what is available, here is an example of the Apple Chancery typeface:

\fontspec[
Colour=CC00CC,
Numbers=OldStyle,
VerticalPosition=Ordinal,
Variant=2]{Apple Chancery}
My 1st example of\\ Apple Chancery

Multiple options may be given to any feature that accepts non-numerical input, although doing so will not always work. Some options will override others in generally obvious ways; Numbers={OldStyle,Lining} doesn't make much sense because the two options are mutually exclusive, and X<sub>\text{T}EX</sub> will simply use the last option that is specified (in this case using Lining over OldStyle).

If a feature or an option is requested that the font does not have, a warning is given in the console output. As mentioned in 1.1.2 on page 2 these warnings can be suppressed by selecting the [quiet] package option.

## 6.1 Different font technologies: AAT and ICU

 $X_{\exists}T_{\exists}X$  supports two rendering technologies for typesetting, selected with the Renderer font feature. The first, AAT, is that provided (only) by Mac OS X itself. The second, ICU, is an open source OpenType interpreter. It provides much greater support for OpenType features, notably contextual arrangement, over AAT.

In general, this feature will not need to be explicitly called: for OpenType fonts, the ICU renderer is used automatically, and for AAT fonts, AAT is chosen by default.

Some fonts, however, will contain font tables for *both* rendering technologies, such as the Hiragino Japanese fonts distributed with Mac OS X, and in these cases the choice may be required.

Among some other font features only available through a specific renderer, ICU provides for the Script and Language features, which allow different font behaviour for different alphabets and languages; see Section 6.19 on page 21 for the description of these features. Because these font features can change which features are able to be selected for the font instance, they are selected by fontspec before all others and will automatically and without warning select the ICU renderer.

## 6.2 Optical font sizes

Optically scaled fonts thicken out as the font size decreases in order to make the glyph shapes more robust (less prone to losing detail), which improves legibility. Conversely, at large optical sizes the serifs and other small details may be more delicately rendered.

Optically sized fonts can be seen in either OpenType or Multiple Master varieties. The differences when dealing with these two are quite significant. OpenType fonts with optical scaling will exist in several discrete sizes, and these will be selected by X¬TEX automatically determined by the current font size. The OpticalSize option may be used to specify a different optical size.

For the OpenType font Warnock Pro, we have three optically sized variants: caption, subhead, and display. With OpticalSize set to zero, no optical size font substitution is performed:

Warnock Pro optical sizes Warnock Pro optical sizes Warnock Pro optical sizes Warnock Pro optical sizes

```
\fontspec[OpticalSize=0] {Warnock Pro Caption}
Warnock Pro optical sizes \\
\fontspec[OpticalSize=0] {Warnock Pro}
Warnock Pro optical sizes \\
\fontspec[OpticalSize=0] {Warnock Pro Subhead}
Warnock Pro optical sizes \\
\fontspec[OpticalSize=0] {Warnock Pro Display}
Warnock Pro optical sizes
```

Automatic OpenType optical scaling is shown in the following example, in which we've scaled down some large text in order to be able to compare the difference for equivalent font sizes: (this gives the same output as we saw in the previous example for Warnock Pro Display)

```
\fontspec{\\armatic optical size}
Automatic optical size
Automatic optical size
\scalebox{0.4}{\\updace}
Automatic optical size}
```

Multiple Master fonts, on the other hand, are parameterised over orthogonal font axes, allowing continuous selection along such features as weight, width, and optical size (see Section 6.18 on page 20 for further details). Whereas an OpenType font will have only a few separate optical sizes, a Multiple Master font's optical size can be specified over a continuous range. Unfortunately, this flexibility makes it harder to create an automatic interface through LaTeX, and the optical size for a Multiple Master font must always be specified explicitly.

	\fontspec[OpticalSize=11]{Minion MM	Roman}
MM optical size test	MM optical size test	//
	\fontspec[OpticalSize=47]{Minion MM	Roman}
MM optical size test	MM optical size test	11
MM optical size test	\fontspec[OpticalSize=71]{Minion MM	Roman}
	MM optical size test	\\

## 6.3 Ligatures

Ligatures refer to the replacement of two separate characters with a specially drawn glyph for functional or æsthetic reasons. For AAT fonts, you may choose from any combination of Required, Common, Rare (or Discretionary), Logos, Rebus, Diphthong, Squared, AbbrevSquared, and Icelandic.

The first three are also supported in OpenType fonts, which may also use Historical and Contextual. To turn a ligature option *off*, prefix its name with No: *e.g.*, NoDiphthong.

```
\fontspec[Ligatures=Rare]{Hoefler Text}
    strict firefly
                                  strict firefly
                                 \fontspec[Ligatures=NoCommon]{Hoefler Text}
    strict firefly
                                  strict firefly
                                  \fontspec
    Rare: Đ Þ ð þ
                                    [Ligatures={Rare,Logos,Rebus,Diphthong}]
                                    {Palatino}
      Logos: 
                                  Rare: Dh Th dh th
      Rebus: ‰
                                                                  //
                                  Logos: apple
Diphthong: ÆŒæœ
                                  Rebus: \%0
                                  Dipht\null hong: AE OE ae oe
```

Some other Apple AAT fonts have those 'Rare' ligatures contained in the Icelandic feature. Notice also that the old  $T_EX$  trick of splitting up a ligature with an empty brace pair does not work in  $X_{\overline{A}}T_EX$ ; you must use a 0 pt kern or \hbox (e.g., \null) to split the characters up.

#### 6.4 Letters

(→ v1.6: This feature has changed names along with its options, **breaking** backwards compatibility!) The Letters feature ( $\leftarrow$ ) specifies how the letters in the current font will look. For AAT fonts, you may choose from Normal, Uppercase, Lowercase, SmallCaps, and InitialCaps.

```
THIS SENTENCE NO VERB
this sentence no verb
This Sentence No Verb

This Sentence No Verb

This Sentence No Verb

\text{fontspec[Letters=Lowercase]{Palatino}}{THIS Sentence no verb} \text{\fontspec[Letters=InitialCaps]{Palatino}}{THIS Sentence no verb}

THIS Sentence no verb
```

OpenType fonts have some different options: Uppercase, SmallCaps, Petite-Caps, UppercaseSmallCaps, UppercasePetiteCaps, and Unicase. ( $\leftarrow$ ) Petite caps are smaller than small caps. Mixed case commands turn lowercase letters into the smaller caps letters, whereas uppercase options turn the capital letters to the

(→ v1.9: The Uppercase... variants have changed (e.g., from SMALL(APS) to allow for more flexible option handling in the future. The old forms still work, for now...) smaller caps (good, *e.g.*, for applying to already uppercase acronyms like 'NASA'). 'Unicase' is a weird hybrid of upper and lower case letters.

THIS SENTENCE NO VERB

```
\fontspec[Letters=SmallCaps]{Warnock Pro}
THIS SENTENCE no verb \\
\fontspec[Letters=UppercaseSmallCaps]{Warnock Pro}
THIS SENTENCE no verb
```

The Uppercase option is also provided *but* it will (probably) not actually map letters to uppercase.<sup>4</sup> It will, however, select various uppercase forms for glyphs such as accents and dashes.

UPPER-CASE EXAMPLE UPPER-CASE EXAMPLE

\fontspec{Warnock Pro}
UPPER-CASE EXAMPLE \\
\addfontfeature{Letters=Uppercase}
UPPER-CASE EXAMPLE

The Kerning feature also contains an Uppercase option, which adds a small amount of spacing in between letters (see Section 6.8 on the following page). This feature was originally planned to be included with the one above (so Letters=Uppercase would do both punctuation *and* tracking), but I decided that it would be a bad idea to break the one-to-one correspondence with fontspec and OpenType features. (Sorry TUGboat readers!)

#### 6.5 Numbers

The Numbers feature defines how numbers will look in the selected font. For both AAT and OpenType fonts, they may be a combination of Lining or OldStyle and Proportional or Monospaced (the latter is good for tabular material). The synonyms Uppercase and Lowercase are equivalent to Lining and OldStyle, respectively. The differences have been shown previously in Section 4.2 on page 7.

For OpenType fonts, there is also the SlashedZero option which replaces the default zero with a slashed version to prevent confusion with an uppercase 'O'.

0123456789 Ø123456789

\fontspec[Numbers=Lining]{Warnock Pro} 0123456789 \fontspec[Numbers=SlashedZero]{Warnock Pro} 0123456789

#### 6.6 Contextuals

( $\rightarrow$  v1.9: This feature used to be called Swashes. This name still

works, for now.)

This feature refers to glyph substitution that vary by their position; things like contextual swashes are implemented here ( $\leftarrow$ ). The options for AAT fonts are WordInitial, WordFinal, LineInitial, LineFinal, and Inner (also called 'nonfinal' sometimes). As non-exclusive selectors, like the ligatures, you can turn them off by prefixing their name with No.

```
where is all the vegemite
```

 $<sup>^4</sup>$ If you want automatic uppercase letters, look into the \MakeUppercase command, as defined by  $\LaTeX$ 

```
'Inner' fwashes can sometimes contain the archaic long s.
```

```
\fontspec[Contextuals=Inner]{Hoefler Text}
`Inner' swashes can \emph{sometimes} \\
contain the archaic long~s.
```

 $(\rightarrow$  V1.9: Used to be Contextual; still works.)

For OpenType fonts, all features as above but the LineInitial feature are supported, and Swash turns on contextual swashes  $(\leftarrow)$ .

```
Without Contextual Swashes
With Contextual Swashes; cf. W C S
```

```
\fontspec{Warnock Pro} \itshape
Without Contextual Swashes \\
\fontspec[Contextuals=Swash]{Warnock Pro}
With Contextual Swashes; cf. W C S
```

Historic forms (*e.g.*, long s as shown above) are accessed in OpenType fonts via the feature Style=Historic; this is generally *not* contextual in OpenType, which is why it is not included here.

#### 6.7 Diacritics

Diacritics refer to characters that include extra marks that usually indicate pronunciation; *e.g.*, accented letters. You may either choose to Show, Hide or Decompose them in AAT fonts.

Some fonts include 0/ etc. as diacritics for writing Ø. You'll want to turn this feature off (imagine typing hello/goodbye and getting 'helløgoodbye' instead!) by decomposing the two characters in the diacritic into the ones you actually want. I would recommend using the proper TEX input conventions for obtaining such characters instead.

```
Ó Ö Ø
O' O'' O/
Better: Ó Ö Ø
```

```
\fontspec[Diacritics=Show]{Palatino}
0 \quad 0 \quad 0/\par
\fontspec[Diacritics=Decompose]{Palatino}
0 \quad 0 \quad 0/\par
Better: \'0 \"0 \0 % (requires xunicode)
```

The Hide option is for Arabic-like fonts which may be displayed either with or without vowel markings.

No options for OpenType fonts.

## 6.8 Kerning

Well designed fonts contain kerning information that controls the spacing between letter pairs, on an individual basis. The Kerning feature provides options to control this, for OpenType fonts only.

The options provided for now are 0n, 0ff, and Uppercase.

```
Ta AV
Ta AV
Ta AV

Ta AV

Ta AV

Ta AV

Ta AV

Ta AV

Ta AV
```

As briefly mentioned previously at the end of Section 6.4 on page 13, the Uppercase option will add a small amount of tracking between uppercase letters:

```
\fontspec{Warnock Pro}
UPPER-CASE EXAMPLE
UPPER-CASE EXAMPLE
\underset{Vaddfontfeature{Kerning=Uppercase}}
UPPER-CASE EXAMPLE
```

## 6.9 Vertical position

Some subscript (Superior) and superscript (Inferior) numbers and letters (and a small amount of punctuation, sometimes) are available in various fonts. The Ordinal feature is (supposed to be) contextually sensitive to only raise characters that appear directly after a number.

```
\fontspec{Skia}
Normal
\text{Normal superior inferior}

1st 2nd 3rd 4th Oth 8abcde

Normal superior inferior

1st 2nd 3rd 4th Oth 8abcde

\text{fontspec[VerticalPosition=Inferior]{Skia}}
Inferior
\text{fontspec[VerticalPosition=Ordinal]{Skia}}

1st 2nd 3rd 4th 0th 8abcde
```

OpenType fonts also have the option ScientificInferior which extends further below the baseline than Inferiors, as well as Numerator and Denominator for creating arbitrary fractions (see next section). Beware, the Ordinal feature will not work correctly for all OpenType fonts!

```
\fontspec[VerticalPosition=Superior]{Warnock Pro}
                               Sup: abdehilmnorst (-\$12,345.67)
                                                                                         //
                              \fontspec[VerticalPosition=Numerator]{Warnock Pro}
  Sup: abdehilmnorst (-$12,345.67)
                               Numerator: 12345
                                                                                         //
     Numerator: 12345
                              \fontspec[VerticalPosition=Denominator]{Warnock Pro}
    Denominator: 12345
                               Denominator: 12345
                                                                                         //
  Scientific Inferior: 12345
                              \fontspec[VerticalPosition=ScientificInferior]{Warnock Pro}
'Ordinals': 1st 2nd 3rd 4th 0th
                               Scientific Inferior: 12345
                                                                                         //
                              \fontspec[VerticalPosition=Ordinal]{Warnock Pro}
                              `Ordinals': 1st 2nd 3rd 4th 0th
```

The xelatex package redefines the \textsubscript and \textsuperscript commands to use the above font features.

#### 6.10 Fractions

Many fonts come with the capability to typeset various forms of fractional material. This is accessed in fontspec with the Fractions feature, which may be turned  $On \ or \ Off \ in \ both \ AAT \ and \ Open Type fonts. (\leftarrow)$ 

In AAT fonts, the 'fraction slash' or solidus character, which may be obtained by typing ' $\nabla \Omega$  1', is (supposed) to be used to create fractions. When Fractions are turned 0n, then (supposedly) only pre-drawn fractions will be used.

```
      ½
      5/6
      \fontspec[Fractions=0n]{Palatino}

      1/2
      5/6
      1/2 \quad 5/6 \\ % fraction slash

      1/2 \quad 5/6
      % regular slash
```

Using the Diagonal option (AAT only), the font will attempt to create the fraction from superscript and subscript characters. This is shown in the following example by Hoefler Text, whose fraction support may actually not be turned off.

(→ v1.7: This feature has changed: no backwards compatibility!)

13579/24680 13579/24680 \fontspec{Hoefler Text} 13579/24680 \\ % fraction slash \quad 13579/24680 % regular slash

OpenType fonts simply use a regular text slash to create fractions:

```
13579/24680
1/2
          5/6
     1/4
         5/6
             13579/24680
```

\fontspec{Hiragino Maru Gothic Pro W4} 1/2 \quad 1/4 \quad 5/6 \quad 13579/24680 \\ \addfontfeature{Fractions=0n} 1/2 \quad 1/4 \quad 5/6 \quad 13579/24680 \\

Some (Asian fonts predominantly, perhaps) also provide for the Alternate feature:

```
1/4 5/6 13579/24680
      13579/24680
```

\fontspec{Hiragino Maru Gothic Pro W4} 1/2 \quad 1/4 \quad 5/6 \quad 13579/24680 \\ \addfontfeature{Fractions=Alternate} 1/2 \quad 1/4 \quad 5/6 \quad 13579/24680 \\

The xelatex package provides a \vfrac command for creating arbitrary socalled 'vulgar' fractions:

13579/24680

\fontspec{Warnock Pro} \vfrac{13579}{24680}

#### 6.11 **Variants**

The Variant feature takes a single numerical input for choosing different alphabetic shapes. Don't mind my fancy example :) I'm just looping through the nine (!) variants of Zapfino.

```
\newcounter{var}\newcounter{trans}
\whiledo{\value{var}<9}{%
  \stepcounter{trans}%
  \fontspec[Variant=\thevar,
    {\tt Colour=005599 \backslash thetrans } \{ {\tt Zapfino} \} \%
  \mbox[0.75\width]{d}%
  \stepcounter{var}}
\vspace{-1cm}
```

For OpenType fonts, Variant selects a 'Stylistic Set', again specified numerically. I don't have a font to demonstrate this feature with, unfortunately.

See Section 7 on page 22 for a way to assign names to variants, which should be done on a per-font basis.

#### 6.12 AAT Alternates

Selection of Alternates in AAT fonts again must be done numerically.

Sphinx Of Black Quartz, Judge Mr Vow

\fontspec[Alternate=0]{Hoefler Text Italic} Sphinx Of Black Quartz, {\scshape Judge My Vow} \\ Sphinx Of Black Quartz, JUDGE Mr Vow \fontspec[Alternate=1] {Hoefler Text Italic} Sphinx Of Black Quartz, {\scshape Judge My Vow}

> See Section 7 on page 22 for a way to assign names to alternates, which should be done on a per-font basis.

#### **6.13** Style

( $\rightarrow$  v1.7: The old name, Style0ptions, still works.)

The options of the Style feature ( $\leftarrow$ ) are defined in AAT as one of the following: Display, Engraved, IlluminatedCaps, Italic, Ruby,<sup>5</sup> TallCaps, or TitlingCaps.

K Q R k v w y K Q R k v w y \fontspec{Warnock Pro}
K Q R k v w y
\addfontfeature{Style=Alternate}
K Q R k v w y

ABCD...WXYZ

\fontspec[Style=Engraved]{Hoefler Text}
[ABCD\dots WXYZ]

ICU supported options are Alternate, Italic, Historic, Ruby, <sup>5</sup> Swash, Titling-Caps, HorizontalKana, and VerticalKana.

{\addfontfeature{Style=VerticalKana}
ようこそ ワカヨタレソ}

## 6.14 CJK shape

There have been many standards for how CJK ideographic glyphs are 'supposed' to look. Some fonts will contain many alternate glyphs available in order to be able to display these gylphs correctly in whichever form is appropriate. Both AAT and OpenType fonts support the following CJKShape options (←): Traditional, Simplified, JIS1978, JIS1983, JIS1990, and Expert. OpenType also supports the NLC option.

(→ v1.9: Was CharacterShape, which wasn't very descriptive. No backwards compatibility.)

> 唖噛躯 妍并訝 唖噛躯 妍并訝 啞嚙軀 妍并訝

<sup>&</sup>lt;sup>5</sup>'Ruby' refers to a small optical size, used in Japanese typography for annotations.

#### 6.15 Character width

(→ v1.9: Was TextSpacing, which wasn't very descriptive. No backwards compatibility.) Many Asian fonts are equipped with variously spaced characters for shoehorning into their generally monospaced text. These are accessed through the CharacterWidth feature. (—) For now, OpenType and AAT share the same six options for this feature: Proportional, Full, Half, Third, Quarter, AlternateProportional, and AlternateHalf. AAT also allows Default to return to whatever was originally specified.

Japanese alphabetic glyphs (in Hiragana or Katakana) may be typeset proportionally, to better fit horizontal measures, or monospaced, to fit into the rigid grid imposed by ideographic typesetting. In this latter case, there are also half-width forms for squeezing more kana glyphs (which are less complex than the kanji they are amongst) into a given block of space. The same features are given to roman letters in Japanese fonts, for typesetting foreign words in the same style as the surrounding text.

```
\def\test{\makebox[2cm][1]{ようこそ}%
\makebox[2.5cm][1]{ワカヨタレソ}%
ようこそ ワカヨタレソ abcdef \makebox[2.5cm][1]{abcdef}}
ようこそ ワカヨタレソ a b c d e f\fontspec{Hiragino Mincho Pro}
ようこそ ワカヨタレソ abcdef {\addfontfeature{CharacterWidth=Proportional}\test}\\
{\addfontfeature{CharacterWidth=Full}\test}\\
{\addfontfeature{CharacterWidth=Half}\test}
```

The same situation occurs with numbers, which are provided in increasingly illegible compressed forms:

```
\label{eq:continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous_continuous
```

The option CharacterWidth=Full doesn't work with the default OpenType font renderer (ICU) due to a bug in the Hiragino fonts.

#### 6.16 Annotation

Various Asian fonts are equipped with a more extensive range of numbers and numerals in different forms. These are accessed through the Annotation feature with the following options: Off, Box, RoundedBox, Circle, BlackCircle, Parenthesis, Period, RomanNumerals, Diamond, BlackSquare, BlackRoundSquare, and DoubleCircle.

<sup>&</sup>lt;sup>6</sup>Apple seems to be adapting its AAT features in this regard (at least in the fonts it distributes with Mac OS X) to have a one-to-one correspondence with the equivalent OpenType features. Previously AAT was more fine grained, but naturally they're not documenting their AAT tables any more, so if the following features don't work for a specific font let me know and I'll try and see if anything can be salvaged from the situation.

```
\fontspec{Hei Regular}
1 2 3 4 5 6 7 8 9 \\
1 2 3 4 5 6 7 8 9 \\fontspec[Annotation=Circle]{Hei Regular}
1 2 3 4 5 6 7 8 9 \\fontspec[Annotation=Circle]{Hei Regular}
1 2 3 4 5 6 7 8 9 \\
1 (2) (3) (4) (5) (6) (7) (8) (9) \fontspec[Annotation=Parenthesis]{Hei Regular}
1 2 3 4 5 6 7 8 9 \\fontspec[Annotation=Period]{Hei Regular}
1 2 3 4 5 6 7 8 9
```

For OpenType fonts, the only option supported is 0n and 0ff:

```
\fontspec{\text{Hiragino Maru Gothic Pro}}
1 2 3 4 5 6 7 8 9
1 2 3 4 5 6 7 8 9
\tag{1} (2) (3) (4) (5) (6) (7) (8) (9)
\tag{2} (4) (5) (6) (7) (8) (9)
\tag{2} 3 4 5 6 7 8 9
```

I'm not sure if  $X_{\overline{A}}T_{\overline{E}}X$  can access alternate annotation forms, even if they exist (as in this case) in the font.

## 6.17 Vertical typesetting

A recent feature of X<sub>\begin{aligned}TEX\end{aligned} is the ability to rotate the glyphs in AAT fonts by 90°, providing a method to typeset vertically by building a horizontal box as normal and then rotating it.</sub>

#### 共産主義者は

```
「fontspec{Hiragino Mincho Pro}
共産主義者は
産
主
う
(fontspec[Renderer=AAT, Vertical=RotatedGlyphs]{Hiragino Mincho Pro}
表
者 (rotatebox{-90}{共産主義者は}% requires the graphicx package
```

The AAT renderer is required above because X<sub>H</sub>T<sub>E</sub>X choses the ICU renderer by preference when both options are available; if it is not explicitly chosen, the glyphs will not be rotated and a warning will be printed in the output.

No actual provision is made for typesetting top-to-bottom languages; for an example of how to do this, see the vertical Chinese example provided in the  $X_{\overline{1}}T_{\overline{1}}X$  documentation.

## 6.18 AAT & Multiple Master font axes

Multiple Master and AAT font specifications both provide continuous variation along font parameters. For example, they don't have just regular and bold weights, they can have any bold weight you like between the two extremes.

Weight, Width, and OpticalSize are supported by this package. Skia, which is distributed with Mac OS X, has two of these variable parameters, allowing for a demonstration:

```
Really light and extended Skia

Really fat and condensed Skia
```

```
\fontspec[Weight=0.5,Width=3]{Skia}
Really light and extended Skia \\
\fontspec[Weight=2,Width=0.5]{Skia}
Really fat and condensed Skia
```

Variations along a multiple master font's optical size axis has been shown previously in Section 6.2 on page 12.

## 6.19 OpenType scripts and languages

When dealing with fonts that include glyphs for various languages, they may contain different font features for the different character sets and languages it supports. These may be selected with the Script and Language features. The possible options are tabulated in Table 1 on the following page and Table 2 on page 23, respectively. When a script or language is requested that is not supported by the current font, a warning is printed in the console output.

Because these font features can change which features are able to be selected for the font, they are selected by fontspec before all others and will specifically select the ICU renderer for this font, as described in Section 6.1 on page 11.

In the following examples, the same font is used to typeset the verbatim input and the  $X_{\Xi}T_{E}X$  output. Because the Script is only specified for the output, the text is rendered incorrectly in the verbatim input. Many examples of incorrect diacritic spacing as well as a lack of contextual ligatures and rearrangement can be seen. Thanks to Jonathan Kew, Yves Codet and Gildas Hamel for their contributions towards these examples.

العربي	\fontspec[Script=Arabic]{Code2000} العربي
हिन्दी	\fontspec[Script=Devanagari]{Code2000} हिन्दी
रलथ	\fontspec[Script=Bengali]{Code2000} लत्थ

தமிழ் தேடி	\fontspec[Script=Tamil]{Code2000} தமிழ் தடேி
ਜਸ਼ਾਜ਼	\fontspec[Script=Hebrew]{Code2000}

And an example of the differences caused by the Vietnamese Language feature: (thanks, JK)

```
\def\viet{cung cấp một con số duy nhất cho mỗi ký tự cung cấp một con số duy nhất cho mỗi ký tự \fontspec{Doulos SIL} \viet\\
\fontspec[Language=Vietnamese]{Doulos SIL} \viet
```

\newfontscript \newfontlanguage Further scripts and languages may be added with the \newfontscript and \newfontlanguage commands. For example,

```
\newfontscript{Arabic}{arab}
\newfontlanguage{Turkish}{TUR}
```

The first argument is the fontspec name, the second the OpenType definition. The advantage to using these commands rather than \newfontfeature (see Section 7) is the error-checking that is performed when the script or language is requested.

## 7 Defining new features

This package cannot hope to contain every possible font feature. Three commands are provided for selecting font features that are not provided for out of the box. If you are using them a lot, chances are I've left something out, so please let me know.

\newAATfeature

New AAT features may be created with this command:

This is XeTeX by Jonathan Kew.

\newAATfeature{Alternate}{HoeflerSwash}{17}{1}
\fontspec[Alternate=HoeflerSwash]{Hoefler Text Italic}
This is XeTeX by Jonathan Kew.

This command replaces \newfeaturecode, which is provided for backwards compatibility via fontspec.cfg.

\newICUfeature

New OpenType features may be created with this command: \newICUfeature{\langle feature \rangle \{\langle option \rangle \} \{\langle feature \tag \rangle \}

Ta AVA

\newICUfeature{Example}{NoKern}{-kern}
\fontspec[Example=NoKern]{Warnock Pro} Ta AVA

Abaza	Default	Ilokano	Koryak	Norway House	Serbian

Table 2: Defined Languages for OpenType fonts. Note that they are sorted alphabetically not by name but by OpenType tag, which is a little irritating, really.

\newfontfeature

In case the above commands do not accommodate the desired font feature (perhaps a new XATEX feature that fontspec hasn't been updated to support), a command is provided to pass arbitrary input into the font selection string:

 $\newfontfeature{\langle name \rangle} {\langle input string \rangle}$ 

For example, Zapfino contains the feature 'Avoid d-collisions'. To access it with this package, you could do the following:

\newfontfeature{AvoidD}{Special=Avoid d-collisions} | Sockdolager rubdown | \newfontfeature{NoAvoidD}{Special=!Avoid | NoAvoidD}{Special=!Avoid | NoAvoidD, Variant=1]{Zapfino} | Sockdolager rubdown | \newfontspec[NoAvoidD, Variant=1]{Zapfino} | NoavoidD, Variant=1]{Zapfino} \newfontfeature{NoAvoidD}{Special=!Avoid d-collisions} sockdolager rubdown

The advantage to using the \newAATfeature and \newICUfeature commands is that they check if the selected font actually contains the font feature. By contrast, \newfontfeature will not give a warning for improper input.

## Renaming existing features & options

If you don't like the name of a particular font feature, it may be aliased to another with the  $\alpha is font feature {\langle existing name \rangle} {\langle new name \rangle} command:$ 

Roman Letters And Swash

\aliasfontfeature{ItalicFeatures}{IF} \fontspec[IF = {Alternate=1}]{Hoefler Text} Roman Letters \itshape And Swash

Spaces in feature (and option names, see below) are allowed. (You may have noticed this already in the lists of OpenType scripts and languages).

\aliasfontfeatureoption

If you wish to change the name of a font feature option, it can be aliased to another with the command \aliasfontfeatureoption{\( font feature \) \} \{\( \left( existing \) name}{ $\langle new \ name \rangle$ }:

Scientific Inferior: 12345

\aliasfontfeature{VerticalPosition}{Vert Pos} \aliasfontfeatureoption{VerticalPosition}{ScientificInferior}{Sci Inf} \fontspec[Vert Pos=Sci Inf]{Warnock Pro} Scientific~Inferior: 12345

This example demonstrates an important point: when aliasing the feature options, the *original* feature name must be used when declaring to which feature the option belongs.

Only feature options that exist as sets of fixed strings may be altered in this way. That is, Proportional can be aliased to Prop in the Letters feature, but 550099BB cannot be substituted for Purple in a Colour specification. For this type of thing, the \newfontfeature command should be used to declare a new, e.g., PurpleColour feature:

\newfontfeature{PurpleColour}{color=550099BB}

## File I

# fontspec.sty

## 8 Implementation

Herein lie the implementation details of this package. Welcome! It's my first.

For some reason, I decided to prefix all the package internal command names and variables with zf. I don't know why I chose those letters, but I guess I just liked the look/feel of them together at the time.

Only proceed if it is X<sub>H</sub>T<sub>E</sub>X that is doing the typesetting.

## 8.1 Bits and pieces

```
Counters, conditionals, ...
8 \newif\ifzf@firsttime
9 \newif\ifzf@tfm
10 \newif\ifzf@atsui
11 \newif\ifzf@icu
12 \newif\ifzf@mm
13 \newif\ifzf@math@euler
14 \newif\ifzf@math@lucida
15 \newif\ifzf@euler@package@loaded
16 \newif\ifzf@package@babel@loaded
17 \newcount\c@zf@newff
18 \newcount\c@zf@index
19 \newcount\c@zf@script
20 \verb|\newcount\c@zf@language|
fontspec shorthands:
```

#### 8.2 Packages

We require the calc package for autoscaling and a recent version of the xkeyval package for option processing.

```
24 \RequirePackage{calc}
25 \RequirePackage{xkeyval}[2005/05/07]
```

## 8.3 Encodings

While the business of encoding names is up in the air, I'll continue to use the U encoding.

```
26 \def\zf@enc{U}
27 %\RequirePackage[\zf@enc]{fontenc}
28 \renewcommand\encodingdefault{\zf@enc}
```

#### Dealing with babel:

```
29 \def\cyrillicencoding{U}%
30 \def\latinencoding{U}%
31 \g@addto@macro\document{%
32 \def\cyrillicencoding{U}%
33 \def\latinencoding{U}}
```

That latin encoding definition is repeated to suppress font warnings. Something to do with \select@language ending up in the .aux file which is read at the beginning of the document.

#### 8.4 User commands

This section contains the definitions of the commands detailed in the user documentation. Only the 'top level' definitions of the commands are contained herein; they all use or define macros which are defined or used later on in Section 8.5 on page 30.

#### 8.4.1 Font selection

\fontspec

This is the main command of the package that selects fonts with various features. It takes two arguments: the Mac OS X font name and the optional requested features of that font. It simply runs \zf@fontspec, which takes the same arguments as the top level macro and puts the new-fangled font family name into the global \zf@family. Then this new font family is selected.

```
34 \newcommand*\fontspec[2][]{%
35 \zf@fontspec{#1}{#2}%
36 \fontfamily\zf@family\selectfont
37 \ignorespaces}
```

\setromanfont \setsansfont \setmonofont The following three macros perform equivalent operations setting the default font (using \let rather than \renewcommand because \zf@family will change in the future) for a particular family: roman, sans serif, or typewriter (monospaced). I end them with \normalfont so that if they're used in the document, the change registers immediately.

```
38 \newcommand*\setromanfont[2][]{%
39 \zf@fontspec{#1}{#2}%
40 \let\rmdefault\zf@family
41 \normalfont}
42 \newcommand*\setsansfont[2][]{%
43 \zf@fontspec{#1}{#2}%
44 \let\sfdefault\zf@family
```

```
45 \normalfont}
46 \newcommand*\setmonofont[2][]{%
47 \zf@fontspec{#1}{#2}%
48 \let\ttdefault\zf@family
49 \normalfont}
```

\setmathsf

\setmathtt

\setmathrm These commands are analogous to \setromanfont and others, but for selecting the font used for \mathrm, etc. They can only be used in the preamble of the document. \setboldmathrm \setboldmathrm is used for specifying which fonts should be used in \boldmath.

```
50 \newcommand*\setmathrm[2][]{%
51 \zf@fontspec{#1}{#2}%
52 \let\zf@rmmaths\zf@family}
53 \newcommand*\setboldmathrm[2][]{%
54 \zf@fontspec{#1}{#2}%
55 \let\zf@rmboldmaths\zf@family}
56 \newcommand*\setmathsf[2][]{%
57 \zf@fontspec{#1}{#2}%
58 \let\zf@sfmaths\zf@family}
59 \newcommand*\setmathtt[2][]{%
60 \zf@fontspec{#1}{#2}%
61 \let\zf@ttmaths\zf@family}
62 \@onlypreamble\setmathrm
63 \@onlypreamble\setboldmathrm
64 \@onlypreamble\setmathsf
65 \@onlypreamble\setmathtt
```

If the commands above are not executed, then \rmdefault (etc.) will be used.

```
66 \def\zf@rmmaths{\rmdefault}
67 \def\zf@sfmaths{\sfdefault}
68 \def\zf@ttmaths{\ttdefault}
```

\newfontinstance

This macro takes the arguments of \fontspec with a prepended \(\lambda\) instance cmd (code for middle optional argument generated by Scott Pakin's newcommand.py). This command is used when a specific font instance needs to be referred to repetitively (e.g., in a section heading) since continuously calling \zf@fontspec is inefficient because it must parse the option arguments every time.

\zf@fontspec defines a font family and saves its name in \zf@family. So then this value is expanded in a temporary macro also containing the unexpanded commands to later select the font family to which it refers. Finally, the requested name for the font instance is \leted from the temporary macro.

```
69 \newcommand*\newfontinstance[1]{%
70 \@ifnextchar[{\newfontinstance@i#1}{\newfontinstance@i#1[]}}
71 \def\newfontinstance@i#1[#2]#3{%
72 \zf@fontspec{#2}{#3}%
   \edef#1{\noexpand\fontfamily{\zf@family}\noexpand\selectfont}}
```

#### 8.4.2 Font feature selection

\defaultfontfeatures

This macro takes one argument that consists of all of feature options that will be applied by default to all subsequent \fontspec, et al., commands. It stores its value in \zf@default@options (initialised empty), which is concatenated with the individual macro choices in the \zf@get@feature@requests macro.

```
74 \enskip 1] {\enskip} $75 \le 2f@default@options $\{\#1,\}\} $75 \le 2f@default@options $\{\#1,\}\} $$
```

\addfontfeatures

In order to be able to extend the feature selection of a given font, two things need to be known: the currently selected features, and the currently selected font. Every time a font family is created, this information is saved inside a control sequence with the name of the font family itself.

This macro extracts this information, then appends the requested font features to add to the already existing ones, and calls the font again with the top level \fontspec command.

The default options are *not* applied (which is why they're saved and restored with \zf@default@options@old), so this means that the only added features to the font are strictly those specified by this command.

\addfontfeature is defined as an alias, as I found that I often typed this instead when adding only a single font feature.

```
76 \newcommand*\addfontfeatures[1]{%
   \let\zf@default@options@old\zf@default@options
   \let\zf@default@options\@empty
78
  \edef\zf@thisinfo{}%
79
80 \edef\@tempa{%
     \noexpand\zf@fontspec
81
        {\csname zf@family@options\f@family\endcsname,#1}%
82
83
        {\csname zf@family@fontname\f@family\endcsname}}%
84
   \@tempa
85
   \fontfamily\zf@family\selectfont
   \let\zf@default@options\zf@default@options@old
   \ignorespaces}
88 \let\addfontfeature\addfontfeatures
```

#### 8.4.3 Defining new font features

\newfontfeature

\newfontfeature takes two arguments: the name of the feature tag by which to reference it, and the string that is used to select the font feature. It uses a counter to keep track of the number of new features introduced; every time a new feature is defined, a control sequence is defined made up of the concatenation of +zf- and the new feature tag. This long-winded control sequence is then called upon to update the font family string when a new instance is requested.

```
89 \newcommand*\newfontfeature[2]{%
90 \stepcounter{zf@newff}%
91 \def@cx{+zf-#1}{+zf-\the\c@zf@newff}%
92 \define@key[zf]{options}{#1}[]{%
93 \zf@update@family{\csname+zf-#1\endcsname}%
94 \zf@update@ff{#2}}}
```

\newAATfeature

This command assigns a new AAT feature by its code (#2,#3) to a new name (#1). Better than \newfontfeature because it checks if the feature exists in the font it's being used for.

```
\unless\ifcsname zf@options@#1\endcsname
                          97
                               \zf@define@font@feature{#1}%
                          98
                          99
                              \ensuremath{\texttt{key@ifundefined[zf]}{\#1}{\#2}{}}
                               \zf@PackageWarning{Option '#2' of font feature '#1' overwritten.}}%
                         \newICUfeature
                         This command assigns a new OpenType feature by its abbreviation (#2) to a new
                         name (#1). Better than \newfontfeature because it checks if the feature exists in
                         the font it's being used for.
                         102 \newcommand*\newICUfeature[3]{%
                              \unless\ifcsname zf@options@#1\endcsname
                                \zf@define@font@feature{#1}%
                         104
                         105 \fi
                         106 \key@ifundefined[zf]{#1}{#2}{}{%
                               \zf@PackageWarning{Option ' #2' of font feature ' #1' overwritten.}}%
                         107
                         108 \quad \texttt{\feature@option} \{\$1\} \{\$2\} \{\} \{\} \{\$3\} \}
      \aliasfontfeature
                        User commands for renaming font features and font feature options. Provided
\aliasfontfeatureoption I've been consistent, they should work for everything.
                         109 \mbox{ newcommand*\aliasfontfeature[2]{\mbox{\mbox{multi@alias@key}}$}}
                         \label{limiting} 110 \newcommand \alias font feature option \[3] {\keyval@alias@key[zf@feat] $$\#1} $$
         \newfontscript
                         111 \newcommand*\newfontscript[2]{%
                         112 \define@key[zf@feat]{Script}{#1}[]{%

95 \newcommand\*\newAATfeature[4]{%

#### **Internal macros**

```
\def@cx Natural counterparts to \@namedef.
135 \providecommand \gdef@cx[2] {\expandafter} \xdef \csname \#1 \endcsname \#2 \} \}
                                                                            136 \providecommand \let@cc[2] \expandafter \let\csname \#1\expandafter \endcsname \#2\endcsname \#2\endcsname
```

\zf@fontspec This is the command that defines font families for use. Given a list of font features for a requested font (#2, stored in \zf@fontname globally for the \zf@make@aat@feature@string macro), it will define an NFSS family for that font and put the family name into \zf@family.

> Then we check with \zf@set@font@type whether the font is AAT or OpenType, and convert the requested features to font definition strings. This is performed with \zf@get@feature@requests, in which \setkeys retrieves the requested font features and processes them. To build up the complex family name, it concatenates each font feature with the family name of the font. So since \setkeys is run more than once (since different font faces may have different feature names), we only want the complex family name to be built up once, hence the \zf@firsttime conditionals.

> In the future, this will be replaced by a dedicated makefamily xkeyval \setkeys declaration. Probably.

> This macro does its processing inside a group, but it's a bit worthless coz there's all sorts of \global action going on. Pity.

> Finally, lots of things are branched out for the pure reason of splitting the code up into logical chunks. Some of it is never even re-used, so it all might be a bit worthless. (E.g., \zf@init and \zf@set@font@type.)

```

                         \zf@firsttimefalse
```

Now we have a unique (in fact, too unique!) string that contains the family name and every option in abbreviated form. This is used with a counter to create a simple NFSS family name for the font we're selecting.

```
\unless\ifcsname zf@UID@\zf@family@long\endcsname
152
                                                                           \ifcsname c@zf@famc@#2\endcsname
                                                                                                 \expandafter\stepcounter\else
153
154
                                                                                                   \expandafter\newcounter\fi
155
                                                                                                                        {zf@famc@#2}%
                                                                           \label{lem:defecx} $$ \ensuremath{$ \ensur
156
```

```
157 \zap@space#2 \@empty
158 (\expandafter\the\csname c@zf@famc@#2\endcsname)}%
159 \fi
160 \xdef\zf@family{\@nameuse{zf@UID@\zf@family@long}}%
```

Now that we have the family name, we can check to see if the family has already been defined, and if not, do so. Once the family name is created, use it to create global macros to save the user string of the requested options and font name, primarily for use with \addfontfeatures.

```
161 \unless\ifcsname zf@family@fontname\zf@family\endcsname
162 \zf@PackageInfo{Defining font family for "#2"
163 with options [\zf@default@options #1]}%
164 \gdef@cx{zf@family@fontname\zf@family}{\zf@fontname}%
165 \gdef@cx{zf@family@options\zf@family}{\zf@default@options #1}%
166 \gdef@cx{zf@family@fontdef\zf@family}{\zf@fontname\zf@suffix:\zf@pre@ff\zf@ff}%
```

Next the font family and its shapes are defined in the NFSS.

All NFSS specifications take their default values, so if any of them are redefined, the shapes will be selected to fit in with the current state. For example, if \bfdefault is redefined to b, all bold shapes defined by this package will also be assigned to b.

The macros \zf@bf, et al., are used to store the name of the custom bold, et al., font, if requested as user options. If they are empty, the default fonts are used.

First we define the font family and define the normal shape: (the specified options are used implicitly)

```
\DeclareFontFamily{\zf@enc}{\zf@family}{}%
\Zf@make@font@shapes{\zf@fontname}{\mddefault}{\updefault}{\zf@font@feat\zf@up@feat}%

Secondly hold Start out by saving the current font features and appending to
```

Secondly, bold. Start out by saving the current font features and appending to them, if any, the extra bold options defined with BoldFeatures. Then, the bold font is defined either as the ATS default (\zf@make@font@shapes' optional argument is to check if there actually is one; if not, the bold NFSS series is left undefined) or with the font specified with the BoldFont feature.

```
169 \ifx\zf@bf\@empty
170 \zf@make@font@shapes[\zf@fontname]{/B}{\bfdefault}{\updefault}{\zf@font@feat\zf@bf@feat}%
171 \else
172 \zf@make@font@shapes{\zf@bf}{\bfdefault}{\updefault}{\zf@font@feat\zf@bf@feat}%
173 \fi
```

And italic in the same way:

```
174 \ifx\zf@it\@empty
175 \zf@make@font@shapes[\zf@fontname]{/I}{\mddefault}{\itdefault}{\zf@font@feat\zf@it@feat}%
176 \else
177 \zf@make@font@shapes{\zf@it}{\mddefault}{\itdefault}{\zf@font@feat\zf@it@feat}%
178 \fi
```

If requested, the custom fonts take precedence when choosing the bold italic font. When both italic and bold fonts are requested and the bold italic font hasn't been explicitly specified (a rare occurance, presumably), the new bold font is used to define the new bold italic font.

```
179 \ifx\zf@bfit\@empty180 \ifx\zf@bf\@empty
```

```
181
                                                                                          \ifx\zf@it\@emptv
182
                                                                               183
184
                                                                               185
                                                                                         \fi
186
                                                                           \else
187
                                                                     \label{lem:lemake} $$ \operatorname{contension}_{I}_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma}(I)_{\sigma

```

#### 8.5.1 Fonts

\zf@set@font@type

This macro sets \zf@atsui or \zf@icu or \zf@mm booleans accordingly depending if the font in \zf@basefont is an AAT font or an OpenType font or a font with feature axes (either AAT or Multiple Master), respectively.

```
195 \newcommand*\zf@set@font@type{%
    \zf@tfmfalse \zf@atsuifalse \zf@icufalse \zf@mmfalse
197
    \ifcase\XeTeXfonttype\zf@basefont
198
      \zf@tfm
199
    \or
       \zf@atsuitrue
200
201
       \ifnum\XeTeXcountvariations\zf@basefont > 0
         \zf@mmtrue
202
203
204
    \or
205
      \zf@icutrue
206
    \fi}
```

\zf@make@font@shapes

This macro uses \DeclareFontShape to define the font shape in question. The arguments are:

- #1#2 the font name,
- #3 the font series,
- #4 the font shape, and
- #5 the font features.

The optional first argument is used when making the font shapes for bold, italic, and bold italic fonts using  $X_{\overline{1}}I_{\overline{1}}EX's$  auto-recognition with #2 as /B, /I, and /BI font name suffixes. If no such font is found, it falls back to the original font name, in which case this macro doesn't proceed and the font shape is not created for the NFSS.

```
207 \newcommand*\zf@make@font@shapes[5][]{%
208 \bgroup
209 \edef\@tempa{#1}%
```

```
\ifx\@tempa\@empty\else
210
         \font\@tempfonta=" #1\zf@suffix" at \f@size pt
211
212
         \edef\@tempa{\fontname\@tempfonta}%
213
      \fi
       \font\@tempfontb=" #1#2\zf@suffix" at \f@size pt
214
215
       \edef\@tempb{\fontname\@tempfontb}%
216
       \ifx\@tempa\@tempb
217
        \zf@PackageInfo{Could not resolve font #1#2 (it might not exist)}%
218
      \else
        \edef\zf@fontname{#1#2}%
219
         \let\zf@basefont\@tempfontb
220
221
         \zf@DeclareFontShape{#3}{#4}{#5}%
```

Next, the small caps are defined. \zf@make@smallcaps is used to define the appropriate string for activating small caps in the font, if they exist. If we are defining small caps for the upright shape, then the small caps shape default is used. For an *italic* font, however, the shape parameter is overloaded and we must call italic small caps by their own identifier. See Section 8.7 on page 50 for the code that enables this usage.

```
\ifx\zf@sc\@empty
222
223
                                                                                                                                      \zf@make@smallcaps
224
                                                                                                                                        \ifx\zf@smallcaps\@empty\else
                                                                                                                                                                 \zf@DeclareFontShape[\zf@smallcaps]{#3}

                                                                                                              \fi
232
233
                                                                                   \fi
234 \egroup}
```

Note that the test for italics to choose the \sidefault shape only works while \zf@fontspec passes single tokens to this macro...

\zf@DeclareFontShape

Wrapper for \DeclareFontShape. Among omitting common arguments, it also fully expands its input upon execution. This is mostly (or only?) useful for the contents of \zf@adjust.

The extra stuff for the slanted shape substitution is a little bit awkward, but I'd rather have it here than break out yet another macro.

```
235 \newcommand \zf@DeclareFontShape[4][]{%}
   \zf@get@feature@requests{#4}%
    \def\@tempb{" \zf@fontname\zf@suffix:\zf@pre@ff\zf@ff#1" }%
    \zf@PackageInfo{\string\font\space is \@tempb}%
238
239
    \edef\@tempa{\noexpand
240
      241
        \label{eq:condition} $$ <->\zf@scale\empb}{\zf@adjust}}%
242 \@tempa
    \edef\@tempa{#3}\edef\@tempb{\itdefault}%
    \ifx\@tempa\@tempb
245
     \edef\@tempa{\noexpand
```

```
246 \DeclareFontShape{\zf@enc}{\zf@family}{#2}{\sldefault}
247 {<->sub*\zf@family/#2/\itdefault}{\zf@adjust}}%
248 \@tempa
249 \fi}
```

\zf@update@family

This macro is used to build up a complex family name based on its features.

 $\verb|\footspec| a true in \verb|\footspec| only the first time \verb|\footspec| feature@requests is called, so that the family name is only created once.$ 

```
250 \newcommand*{\zf@update@family}[1]{%
251 \ifzf@firsttime
252 \xdef\zf@family@long{\zf@family@long#1}%
253 \fi}
```

#### 8.5.2 Features

\zf@get@feature@requests

This macro is a wrapper for \setkeys which expands and adds a default specification to the original passed options. It begins by initialising the commands used to hold font-feature specific strings.

```
254 \newcommand*\zf@get@feature@requests[1]{%
255 \let\zf@ff \@empty
256 \let\zf@scale \@empty
257 \let\zf@adjust \@empty
258 \edef\@tempa{\noexpand\setkeys[zf]{options}{\zf@default@options#1}}%
259 \@tempa}
```

\zf@init This functionality has been removed from \zf@get@feature@requests because it's no longer the first thing that can affect these things.

```
260 \newcommand*\zf@init{%
261 \let\zf@pre@ff
                       \@empty
    \let\zf@font@feat
                       \@empty
263 \let\zf@suffix
                       \@empty
264 \let\zf@bf
                       \@empty
265 \let\zf@it
                       \@empty
266 \let\zf@bfit
                       \@empty
267 \let\zf@sc
                       \@empty
268 \let\zf@up@feat
                       \@empty
269 \let\zf@bf@feat
                       \@empty
270 \let\zf@it@feat
                       \@empty
271 \let\zf@bfit@feat \@empty
272 \let\zf@sc@feat
                       \@empty
273 \c@zf@script 1818326126\relax
274 \def\zf@script@name{Latin}%
275 \c@zf@language 0\relax
    \def\zf@language@name{Default}%
276
277 }
```

\zf@make@smallcaps

This macro checks if the font contains small caps, and if so creates the string for accessing them in \zf@smallcaps.

 $278 \verb|\newcommand*\zf@make@smallcaps{}\%$ 

```
279 \let\zf@smallcaps\@empty
280 \ifzf@atsui
281
      \zf@make@aat@feature@string{3}{3}%
282
      \unless\ifx\zf@thisfontfeature\@empty

      \fi
290
291 \fi}
```

#### \zf@update@ff

\zf@ff is the string used to define the list of specific font features. Each time another font feature is requested, this macro is used to add that feature to the list. AAT features are separated by semicolons, OpenType features by commas.

```
292\newcommand*\zf@update@ff[1]{%
293 \unless\ifzf@firsttime
294 \xdef\zf@ff{\zf@ff #1\ifzf@icu,\else;\fi}%
295 \fi}
```

#### \zf@make@feature

This macro is called by each feature key selected, and runs according to which type of font is selected.

```
296 \newcommand*\zf@make@feature[3]{%
297
    ∖ifzf@atsui
298
      \zf@make@aat@feature@string{#1}{#2}%
      \ifx\zf@thisfontfeature\@empty
299

```

\zf@define@font@feature \zf@define@feature@option These macros are used in order to simplify font feature definition later on.

```
320 \newcommand*\zf@define@font@feature[1]{%
321 \define@key[zf]{options}{#1}{{\setkeys[zf@feat]{#1}{\#1}}}
322 \newcommand*\zf@define@feature@option[5]{%
323 \define@key[zf@feat]{#1}{\zf@make@feature{\#3}{\#4}{\#5}}}
```

\keyval@alias@key

This macro maps one xkeyval key to another.

```
324 \newcommand*\keyval@alias@key[4][KV]{%
325 \let@cc{#1@#2@#4}{#1@#2@#3}%
326 \let@cc{#1@#2@#4@default}{#1@#2@#3@default}}
```

\multi@alias@key

This macro iterates through families to map one key to another, regardless of which family it's contained within.

\zf@make@aat@feature@string

This macro takes the numerical codes for a font feature and creates a specified macro containing the string required in the font definition to turn that feature on or off. Used primarily in \zf@make@aat@feature, but also used to check if small caps exists in the requested font.

```
334 \newcommand*\zf@make@aat@feature@string[2]{%}
    \edef\zf@this@featurename{\XeTeXfeaturename\zf@basefont #1}%
    \ifx\zf@this@featurename\@empty
336
      \let\zf@thisfontfeature\@empty

               \zf@this@featurename=\zf@this@selectionname
351
             \fi
352
           \fi}%
      \fi
353
    \fi}
```

\zf@iv@strnum \zf@v@strnum This macro takes a four character string and converts it to the numerical representation required for X<sub>H</sub>T<sub>E</sub>X OpenType script/language/feature purposes. The output is stored in \@tempcnta.

The reason it's ugly is because the input can be of the form of any of these: 'abcd', 'abc', 'abc', 'ab', 'ab', 'etc. (It is assumed the first two chars are always not spaces.) So this macro reads in the string, delimited by a space; this input is padded with \@emptys and anything beyond four chars is snipped. The \@emptys then are used to reconstruct the spaces in the string to number calculation.

The variant \zf@v@strnum is used when looking at features, which are passed around with prepended plus and minus signs (*e.g.*, +liga, -dlig); it simply strips off the first char of the input before calling the normal \zf@iv@strnum.

It's probable that all OpenType features *are* in fact four characters long, but not impossible that they aren't. So I'll leave the less efficient parsing stage in there even though it's not strictly necessary for now.

```
355 \newcommand\zf@iv@strnum[1]{%
356 \zf@iv@strnum@i#1 \@nil}
357 \def\zf@iv@strnum@i#1 \@nil{%

```

# 8.6 keyval definitions

This is the tedious section where we correlate all possible (eventually) font feature requests with their  $X_{\overline{A}}$  representations.

### 8.6.1 Bold/italic choosing options

The Bold, Italic, and BoldItalic features are for defining explicitly the bold and italic fonts used in a font family. v1.6 introduced arbitrary font features for these shapes (BoldFeatures, etc.), so the names of the shape-selecting options were appended with Font for consistency.

#### **Fonts**

```
407 \define@key[zf]{preparse}{BoldFont}{%
408  \zf@partial@fontname#1\@nil
409  \let\zf@bf\@tempa
410  \edef\zf@family@long{\zf@family@long bf:#1}}
411 \define@key[zf]{preparse}{ItalicFont}{%
412  \zf@partial@fontname#1\@nil
```

```
413 \let\zf@it\@tempa
414 \edef\zf@family@long{\zf@family@long it:#1}}
415 \define@key[zf]{preparse}{BoldItalicFont}{%
416 \zf@partial@fontname#1\@nil
417 \let\zf@bfit\@tempa
418 \edef\zf@family@long{\zf@family@long bfit:#1}}
419 \define@key[zf]{options}{SmallCapsFont}{%
420 \zf@partial@fontname#1\@nil
421 \let\zf@sc\@tempa
422 \zf@update@family{sc:\zap@space #1 \@empty}}
```

\zf@partial@fontname

This macro takes the next token and ends up defining <code>\@tempa</code> to the name of the font depending if it's been specified in full ("Baskerville Semibold") or in abbreviation ("\* Semibold").

```
423 \def\zf@partial@fontname#1#2\@nil{%
424 \if#1*\relax
425 \edef\@tempa{\zf@fontname#2}%
426 \else
427 \edef\@tempa{#1#2}%
428 \fi}
```

**Features** Note that small caps features can vary by shape, so these in fact *aren't* pre-parsed.

```
429 \define@key[zf]{preparse}{UprightFeatures}{%
430  \def\zf@up@feat{,#1}%
431  \edef\zf@family@long{\zf@family@long rmfeat:#1}}
432 \define@key[zf]{preparse}{BoldFeatures}{%
433  \def\zf@bf@feat{,#1}%
434  \edef\zf@family@long{\zf@family@long bffeat:#1}}
435 \define@key[zf]{preparse}{ItalicFeatures}{%
436  \def\zf@it@feat{,#1}%
437  \edef\zf@family@long{\zf@family@long itfeat:#1}}
438 \define@key[zf]{preparse}{BoldItalicFeatures}{%
439  \def\zf@bfit@feat{,#1}%
440  \edef\zf@family@long{\zf@family@long bfitfeat:#1}}
441 \define@key[zf]{options}{SmallCapsFeatures}{%
442  \unless\ifzf@firsttime\def\zf@sc@feat{,#1}\fi
443  \zf@update@family{scfeat:\zap@space #1 \@empty}}
```

### 8.6.2 The Renderer pre-parsed feature

This feature must be processed before all others (the other font shape and features options are also pre-parsed for convenience) because the renderer determines the format of the features and even whether certain features are available.

```
444\define@choicekey[zf]{preparse}{Renderer}{AAT,ICU}{%

445 \edef\zf@suffix{\zf@suffix/#1}%

446 \font\zf@basefont="\zf@fontname\zf@suffix" at \f@size pt

447 \edef\zf@family@long{\zf@family@long +rend:#1}}
```

**OpenType script/language** See later for the resolutions from fontspec features to OpenType definitions.

```
448 \define@key[zf]{preparse}{Script}{%
449 \edef\zf@suffix{\zf@suffix/ICU}%
450 \font\zf@basefont="\zf@fontname\zf@suffix" at \f@size pt
451 \edef\zf@family@long{\zf@family@long +script:#1}
452 {\setkeys[zf@feat]{Script}{#1}}}

Exactly the same:
453 \define@key[zf]{preparse}{Language}{%
454 \edef\zf@suffix{\zf@suffix/ICU}%
455 \font\zf@basefont="\zf@fontname\zf@suffix" at \f@size pt
456 \edef\zf@family@long{\zf@family@long +language:#1}
457 {\setkeys[zf@feat]{Lang}{#1}}
```

#### 8.6.3 Font-independent features

These features can be applied to any font.

**Scale** If the input isn't one of the pre-defined string options, then it's gotta be numerical. \zf@calc@scale does all the work in the auto-scaling cases.

```
458 \define@key[zf]{options}{Scale}{%
459 \edef\@tempa{#1}%
460
   \edef\@tempb{MatchLowercase}%
    \ifx\@tempa\@tempb
461
     \zf@calc@scale{5}%
462
    \else
463
      \edef\@tempb{MatchUppercase}%
464
465
      \ifx\@tempa\@tempb
466
        \zf@calc@scale{8}%
467
468
        \edef\zf@scale{#1}%
469
    \fi
470
    \zf@update@family{+scale:\zf@scale}%
471
    \edef\zf@scale{s*[\zf@scale]}}
```

\zf@calc@scale

This macro calculates the amount of scaling between the default roman font and the (default shape of) the font being selected such that the font dimension that is input is equal for both. The only font dimensions that justify this are 5 (lowercase height) and 8 (uppercase height in X<sub>H</sub>T<sub>E</sub>X).

This script is executed for every extra shape, which seems wasteful, but allows alternate italic shapes from a separate font, say, to be loaded and to be auto-scaled correctly. Even if this would be ugly.

```
473 \newcommand\zf@calc@scale[1]{%
474 \begingroup
475 \rmfamily
476 \setlength\@tempdima{\fontdimen#1\font}%
477 \setlength\@tempdimb{\fontdimen#1\zf@basefont}%
478 \setlength\@tempdimc{1pt*\ratio{\@tempdima}{\@tempdimb}}%
```

```
479 \xdef\zf@scale{\strip@pt\@tempdimc}
480 \zf@PackageInfo{\zf@fontname\space scale = \zf@scale}%
481 \endgroup}
```

Inter-word space These options set the relevant \fontdimens for the font being loaded

```
482 \define@key[zf]{options}{WordSpace}{%
483  \zf@update@family{+wordspace:#1}%
484  \unless\ifzf@firsttime
485  \zf@wordspace@parse#1,\zf@@ii,\zf@@iii,\zf@@
486  \fi}
```

\zf@wordspace@parse

This macro determines if the input to WordSpace is of the form  $\{X\}$  or  $\{X,Y,Z\}$  and executes the font scaling. If the former input, it executes  $\{X,X,X\}$ .

```
\def\@tempa{#4}%
488
489
    \ifx\@tempa\@empty
490
      \q@addto@macro\zf@adjust{%
        \fontdimen2\font#1\fontdimen2\font

## 8.6.5 Ligatures

The call to the nested keyval family must be wrapped in braces to hide the parent list (this later requires the use of global definitions (\xdef) in \zf@update@...). Both AAT and OpenType names are offered to chose Rare/Discretionary ligatures.

```
554 \zf@define@font@feature{Ligatures}
555 \zf@define@feature@option{Ligatures}{Required}
                                                                                                                                                                  {1}{0}{+rlig}
556 \zf@define@feature@option{Ligatures}{NoRequired}
                                                                                                                                                                  {1}{1}{-rlia}
557 \zf@define@feature@option{Ligatures}{Common}
                                                                                                                                                                  {1}{2}{+liga}

```

#### 8.6.6 Letters

```
 579 \end{fine} font \end{fine} font \end{fine} font \end{fine} feature \end{fine} feat
```

## 8.6.7 Numbers

These were originally separated into NumberCase and NumberSpacing following AAT, but it makes more sense to combine them.

Both naming conventions are offered to select the number case.

```
\label{lem:space} $589 \times e^0 e^0 \exp(-1) \times e^0 \times e^0 \exp(-1) = e^0 \times e^0 \times e^0 \exp(-1) = e^0 \times e^0 \times
```

```
\label{thm:proportional} $\{6\}\{1\}\{+pnum\} $592 \times f@define@feature@option\{Numbers\}\{Lowercase\}\{21\}\{0\}\{+onum\} $593 \times f@define@feature@option\{Numbers\}\{OldStyle\}\{21\}\{0\}\{+onum\} $594 \times f@define@feature@option\{Numbers\}\{Uppercase\}\{21\}\{1\}\{+lnum\} $595 \times f@define@feature@option\{Numbers\}\{Lining\}\{21\}\{1\}\{+lnum\} $596 \times f@define@feature@option\{Numbers\}\{SlashedZero\}\{14\}\{5\}\{+zero\} $597 \times f@define@feature@option\{Numbers\}\{NoSlashedZero\}\{14\}\{4\}\{-zero\} $120 \times f(0) \times f(
```

#### 8.6.8 Contextuals

#### 8.6.9 Diacritics

```
 611 \ f(\theta) = 10 \ f(\theta) \ f(
```

#### **8.6.10** Kerning

```
615 \zf@define@font@feature{Kerning}
616 \zf@define@feature@option{Kerning}{Uppercase}{}{}+cpsp}
617 \zf@define@feature@option{Kerning}{On}{}{}+kern}
618 \zf@define@feature@option{Kerning}{Off}{}{}-kern}
619 %\zf@define@feature@option{Kerning}{Vertical}{}{}+vkrn}
620 %\zf@define@feature@option{Kerning}{VerticalAlternateProportional}{}{}+vpal}
621 %\zf@define@feature@option{Kerning}{VerticalAlternateHalfWidth}{}}{}+vhal}
```

#### 8.6.11 Vertical position

#### 8.6.12 Fractions

 $630 \verb|\zf@define@font@feature{Fractions}|$ 

```
 631 \ for each of the continuous formula of the continuous formula
```

#### 8.6.13 Alternates and variants

Selected numerically because they don't have standard names. Very easy to process, very annoying for the user!

```
635 \define@key[zf]{options}{Alternate}{%
636  \setkeys*[zf@feat]{Alternate}{#1}%
637  \unless\ifx\XKV@rm\@empty
638  \zf@make@feature{17}{#1}{}%
639  \fi}
640 \define@key[zf]{options}{Variant}{%
641  \setkeys*[zf@feat]{Variant}{#1}%
642  \unless\ifx\XKV@rm\@empty
643  \zf@make@feature{18}{#1}{+ss\two@digits{#1}}%
644  \fi}
```

# 8.6.14 Style

```
645 \zf@define@font@feature{Style}
646 \zf@define@feature@option{Style}{Alternate}{}{}+salt}
647 \zf@define@feature@option{Style}{Italic}{32}{2}{+ital}

# Italic small caps

The following code for utilising italic small caps sensibly is inspired from Philip Lehman's The Font Installation Guide. Note that \upshape needs to be used twice to get from italic small caps to regular upright (it always goes to small caps, then regular upright).

\textsi

\sishape First, the commands for actually selecting italic small caps are defined. I use si as the NFSS shape for italic small caps, but I have seen itsc and slsc also used. \sidefault may be redefined to one of these if required for compatibility.

```
860 \providecommand*{\sidefault}{si}
861 \DeclareRobustCommand{\sishape}{%
    \not@math@alphabet\sishape\relax
    \fontshape\sidefault\selectfont}
864 \DeclareTextFontCommand{\textsi}{\sishape}
```

\zf@merge@shape

This is the macro which enables the overload on the \...shape commands. It takes three such arguments. In essence, the macro selects the first argument, unless the second argument is already selected, in which case it selects the third.

```
865 \mbox{ newcommand*{\zf@merge@shape}[3]{}}
          866
               \edef\@tempa{#1}%
                \ensuremath{\texttt{\ensuremath{\texttt{\footstar}}}\xspace \%}
                \ifx\f@shape\eta=mpb
                  \fertilde{f@encoding/\fefamily/\f@series/#3\endcsname}
          870
                    871
                 \fi
          872 \fi
          873 \fontshape{\@tempa}\selectfont}
\itshape Here the original \...shape commands are redefined to use the merge shape
\scshape macro.
\verb|\upshape| 874 \verb|\DeclareRobustCommand{{\titshape}}{ } { } %
          875 \not@math@alphabet\itshape\mathit
                \zf@merge@shape\itdefault\scdefault\sidefault}
```

```
877 \DeclareRobustCommand{\slshape}{%
878  \notemath@alphabet\slshape\relax
879  \zfemerge@shape\sldefault\scdefault\sidefault}
880 \DeclareRobustCommand{\scshape}{%
881  \notemath@alphabet\scshape\relax
882  \zfemerge@shape\scdefault\itdefault\sidefault}
883 \DeclareRobustCommand{\upshape}{%
884  \notemath@alphabet\upshape\relax
885  \zfemerge@shape\updefault\sidefault\scdefault}
```

\emptyset It's not 100% reliable to use the \fontdimen of the italic shapes defined by X<sub>\text{H}</sub>T<sub>E</sub>X, \emptyset \text{EMP} I think, so copy \emptyset \text{empth} definition from fixItx2e.

```
886 \AtBeginDocument{%
     \DeclareRobustCommand\em
887
888
       {\@nomath\em
889
        \edef\@tempa{\f@shape}%
        \edef\@tempb{\itdefault}%
890
        \ifx\@tempa\@tempb
          \eminnershape
893
        \else
894
          \emshape
895
        \fi}}
896 \verb|\DeclareTextFontCommand{\emph}{\embed} 
897 \let\emshape\itshape
898 \let\eminnershape\upshape
```

# 8.8 Selecting maths fonts

Here, the fonts used in math mode are redefined to correspond to the default roman, sans serif and typewriter fonts. Unfortunately, you can only define maths fonts in the preamble, otherwise I'd run this code whenever \setromanfont and friends was run.

**\AtBeginDocument** 

Everything here is performed \AtBeginDocument in order to overwrite euler's attempt. This means fontspec must be loaded *before* euler. We set up a conditional to return an error if this rule is violated.

Since every maths setup is slightly different, we also take different paths for defining various math glyphs depending which maths font package has been loaded. As far as I am aware, the only two options for X<sub>\textit{T}EX</sub> are euler and lucbmath. Unless I've got all confused and the mathtime fonts are not virtual fonts either. But I'm pretty sure they are.

```
\zf@PackageError{The euler package must be loaded BEFORE fontspec}
908
           {fontspec only overwrites euler's attempt to \MessageBreak
909
910
            define the maths text fonts if fontspec is \MessageBreak
911
            loaded after euler. Type <return> to proceed\MessageBreak
912
           with incorrect \protect\mathit, \protect\mathbf, etc}
913
      \fi}{}
    \@ifpackageloaded{lucbmath}{\zf@math@lucidatrue}{}
915
    \@ifpackageloaded{lucidabr}{\zf@math@lucidatrue}{}
    \@ifpackageloaded{lucimatx}{\zf@math@lucidatrue}{}
```

Knuth's CM fonts fonts are all squashed together, combining letters, accents, text symbols and maths symbols all in the one font, cmr, plus other things in other fonts. Because we are changing the roman font in the document, we need to redefine all of the maths glyphs in LaTeX's operators maths font to still go back to the legacy cmr font for all these random glyphs, unless a separate maths font package has been loaded instead.

In every case, the maths accents are always taken from the operators font, which is generally the main text font. (Actually, there is a \hat accent in Euler-Fractur, but it's ugly. So I ignore it. Sorry if this causes inconvenience.)

```
\DeclareSymbolFont{legacymaths}{OT1}{cmr}{m}{n}
918
    \SetSymbolFont{legacymaths}{bold}{OT1}{cmr}{bx}{n}
919 \DeclareMathAccent{\acute} {\mathalpha}{legacymaths}{19}
920 \DeclareMathAccent{\grave} {\mathalpha}{legacymaths}{18}
921 \DeclareMathAccent{\ddot}
                                 {\mathalpha}{legacymaths}{127}
   \DeclareMathAccent{\tilde} {\mathalpha}{legacymaths}{126}
922
923
   \DeclareMathAccent{\bar}
                                 {\mathalpha}{legacymaths}{22}
   \DeclareMathAccent{\breve}
                                 {\mathalpha}{legacymaths}{21}
    \DeclareMathAccent{\check}
                                {\mathalpha}{legacymaths}{20}
    \DeclareMathAccent{\hat}
                                 {\mathalpha}{legacymaths}{94} % too bad, euler
    \DeclareMathAccent{\dot}
                                 {\mathalpha}{legacymaths}{95}
928 \ \DeclareMathAccent{\mathring}{\mathalpha}{legacymaths}{23}
```

\colon: what's going on? Okay, so: and \colon in maths mode are defined in a few places, so I need to work out what does what. Respectively, we have:

```
% fontmath.ltx:
\DeclareMathSymbol{\colon}{\mathpunct}{operators}{" 3A}
\DeclareMathSymbol{:}{\mathrel}{operators}{" 3A}

% amsmath.sty:
\renewcommand{\colon}{\nobreak\mskip2mu\mathpunct{}\nonscript\\mkern-\thinmuskip{:}\mskip6muplus1mu\relax}

% euler.sty:
\DeclareMathSymbol{:}\mathrel {EulerFraktur}{" 3A}

% lucbmath.sty:
\DeclareMathSymbol{\@tempb}{\mathpunct}{operators}{58}
\ifx\colon\@tempb
\DeclareMathSymbol{\colon}{\mathpunct}{operators}{58}
```

```
\fi
```

\DeclareMathSymbol{:}{\mathrel}{operators}{58}

 $(3A_{16} = 58_{10})$  So I think, based on this summary, that it is fair to tell fontspec to 'replace' the operators font with legacymaths for this symbol, except when amsmath is loaded since we want to keep its definition.

```
929 \begingroup
930 \mathchardef\@tempa=" 603A %
931 \let\next\egroup
932 \ifx\colon\@tempa
933 \DeclareMathSymbol{\colon}{\mathpunct}{legacymaths}{58}
934 \fi
935 \endgroup
```

The following symbols are only defined specifically in euler, so skip them if that package is loaded.

```
936 \ifzf@math@euler\else
937 \DeclareMathSymbol{!}{\mathclose}{legacymaths}{33}
938 \DeclareMathSymbol{:}{\mathrel} {legacymaths}{58}
939 \DeclareMathSymbol{;}{\mathpunct}{legacymaths}{59}
940 \DeclareMathSymbol{?}{\mathclose}{legacymaths}{63}
```

And these ones are defined both in euler and lucbmath, so we only need to run this code if no extra maths package has been loaded.

```
941
                          \ifzf@math@lucida\else
                                  \DeclareMathSymbol{0}{\mathalpha}{legacymaths}{ '0}
942
943
                                  \DeclareMathSymbol{1}{\mathalpha}{legacymaths}{
                                  \DeclareMathSymbol{2}{\mathalpha}{legacymaths}{

970 \DeclareMathSymbol{\mathdollar}{\mathord}{legacymaths}{36}
971 \fi
972 \fi
```

Finally, we change the font definitions for \mathrm and so on. These are defined using the \zf@rmmaths (...) macros, which default to \rmdefault but may be specified with the \setmathrm (...) commands in the preamble.

Since LATEX only generally defines one level of boldness, we omit \mathbf in the bold maths series. It can be specified as per usual with \setboldmathrm, which stores the appropriate family name in \zf@rmboldmaths.

```
974
          976
          \SetMathAlphabet\mathit{normal}\zf@enc\zf@rmmaths\mddefault\itdefault
977
          \SetMathAlphabet\mathbf{normal}\zf@enc\zf@rmmaths\bfdefault\updefault
          978
          979
          981
           \ifdefined\zf@rmboldmaths
982
               \SetMathAlphabet\mathrm{bold}\zf@enc\zf@rmboldmaths\mddefault\updefault
               983
               \verb|\SetMathAlphabet\mathit{bold}\xspace{|c|} \xspace{|c|} \xspace{|c|

19 \begin{document}
20 \pagestyle{empty}
22\section{The basics of the \textsf{fontspec} package}
24 The \textsf{fontspec} package enables automatic font selection for \LaTeX{} doc-
  uments typeset with \XeTeX{}. The basic command is\\
25\indent \verb\\fontspec[font features]{Mac OS X font display name}\.\\
26 As an example:
27
28 \begin{center}
29 \Large
30 \fontspec[
31
        Colour
                         = 0000CC,
                         = OldStyle,
32
        Numbers
        VerticalPosition = Ordinal,
33
34
        Variant
                         = 2
35
             ]{Apple Chancery}
36 My 1st example of Apple Chancery
37 \end{center}
39 The default roman, sans serif, and typewriter fonts may be set with the \verb|\setromanfont|, \verb|\set
  mands, respectively, as shown in the preamble. They take the same syn-
  tax as the \verb|\fontspec| package. All expected font shapes are available:
40
41 \begin{center}
42 {\sc shape Small caps and \itshape small caps italic\dots}
43 {\sffamily\bfseries Bold sans serif and \itshape bold italic sans serif\dots}
44 \end{center}
45
46 With the roman and sans serif fonts set in the preamble, text fonts in math mode are also changed: $\cos(n
  face 'Euler' has been used in this document (with the \textsf{euler} pack-
  age---note that the \textsf{eulervm} package will not work in \Xe-
 TeX{} because it uses virtual fonts), since the default Computer Mod-
  ern maths font is rather light.
48 \mathcal F(s) = \inf \{-st\} \setminus \{d\}t
49 \]
51 You'll also notice the \verb\\defaultfontfeatures| command in the pream-
  ble. This command takes a single argument of font features that are then ap-
  plied to every subsequent instance of font selection. The first argu-
  ment in this case, \ensuremath{\mbox{\sc werb|Mapping=tex-text|}}, enables regular \ensuremath{\mbox{\sc TeX}\{\}} liga-
  tures like \ensuremath{\mbox{\sc verbl}} ' '---''. The second automatically scales the fonts to the same x-
  height.
```

52

 $53\,\mbox{Please}$  see the documentation for font feature explanation and further package niceties.

54

55 \end{document}

# **Change History**

v1.0	
General: Initial version.	25
v1.1	
General: Name change to fontspec.	25
\setromanfont: Implemented (with friends).	27
v1.10	
General: Color brought back into the .sty	42
New feature LetterSpacing.	41
Some babel encoding problems resolved.	26
\addfontfeatures: Saved family information macro changes.	28
\AtBeginDocument: Added lucimatx checking. (Not really tested, though.)	51
Fixed Lucida bug (missing \else)	51
\zf@fontspec: Saved family info split into two (now three) macros.	32
Space zapped from LaTeX family name due to various problems.	32
\zf@make@feature: Removed embarrassing space after warnings.	35
v1.2	
General: Initial OpenType support.	25
Support for Scale.	40
v1.3	
General: More OpenType support.	25
Support for Mapping and Colour.	42
\defaultfontfeatures: Implemented.	28
\newAATfeature: Implemented.	29
\newfontfeature: Implemented.	28
v1.3a	
General: Bug fix for OpenType small caps.	43
v1.4	
General: Support for Weight and Width AAT features.	42
\AtBeginDocument: Selects the default \mathXX fonts.	51
\defaultfontfeatures: Name changed from \setdefaultoptions.	28
v1.5	20
General: New options for arbitrary bold/italic shapes.	38
\addfontfeatures: Implemented.	28
\zf@fontspec: Added code for choosing arbitrary bold/italic fonts.	32
Checks if the font family has already been defined.	32
NFSS specifiers now take the default values.	32
\zf@make@font@shapes: Absorbed font-checking from \zf@fontspec.	33
v1.5a	F1
\AtBeginDocument: Added fix for Computer Modern maths.	51
V1.6 Conoral: Bald option aligned to BaldFort	38
General: Bold option aliased to BoldFont.	30 43
LetterCase is now Letters and options changed appropriately.	40
Scale feature now updates family name. All AAT Fractions features offered.	40
New OpenType feature: Language	47
New OpenType feature: Language New OpenType feature: Script	46
OpenType leature: Script OpenType letters features: PetiteCaps and PETITECAPS.	43
OpenType leatures leatures: Petitecaps and Petitecaps.  OpenType ligature features: Contextual and Historical.	43
OpenType stylistic sets supports under the Variant option.	45
\addfontfeatures: Removed \relaxing of temporary macros.	28
(www. o) colon co. relitored to claying of temporary materials	20

\AtBeginDocument: Removed mathtime support since XeTeX doesn't handle	
virtual fonts. Why did I put it in in the first place?	51
\fontspec: Removed \zf@currfont (unnecessary)	26
\newfontfeature: newff counter now uses LaTeX methods rather than prim-	
itive TeX. I don't know if there is any advantage to this.	28
\newfontinstance: Implemented.	27
	27
\zf@fontspec: Added code for choosing arbitrary bold/italic font features.	32
Writes some info to the .log file	32
\zf@get@feature@requests: Removed the space between the comma and	
\zf@options when it's concatenated with the defaults.	34
v1.7	
General: Style feature renamed from StyleOptions.	45
AAT Numbers:SlashedZero.	43
New feature: Annotation	46
New feature: CharacterShape	45
New feature: CharacterWidth	45
New feature: OpticalSize; works with both OpenType and MM fonts.	42
OpenType Alternate Fractions feature.	44
1 71	45
Removed AAT check for weight/width axes (could also be Multiple Master)	42
\zf@define@feature@option: Implemented for the bulk of the feature pro-	
cessing code.	36
\zf@fontspec: Optional argument now mandatory.	32
\zf@make@aat@feature@string: Changed some \edefs to \let	36
Removed third argument; always saves the feature string in \zf@thisfontfe	
\zf@make@feature: Accommodation of the \zf@thisfontfeature change.	35
\zf@make@font@shapes: Changed some \edefs to \let.	33
Support for the OpticalSize feature.	33
\zf@make@smallcaps: Accommodation of the \zf@thisfontfeature change.	35
\zf@set@font@type: Added 'MM' font type; tests true, e.g., with Skia & Min-	
ion MM. Used with the Optical Size feature.	32
Removed exclusivity from font type (AAT, OpenType) check, since fonts	
can be both.	32
Removed various \count255s.	32
\zf@update@ff: Fix for featureless fonts (e.g., the MS fonts) being ignored.	35
v1.8	
	51
Finally fixed legacy maths font issues. Also checks that euler.sty is loaded	
O .	51
\setmathrm: Implemented (with friends).	27
v1.8a	
\AtBeginDocument: Added conditional to \colon math symbol (incompatibil-	=4
ity with lucida and amsmath)	51
v1.9	45
General: CharacterShape now CJKShape	45
SMALLCAPS option changed to UppercaseSmallCaps to facilitate option nor-	10
malisation (to come). Similarly for PETITECAPS.	43
Swashes feature changed to Contextuals. Option of this feature Contextual	
all and a distance of the contractions are a second	4.4
changed to Swash, for obvious reasons.  TextSpacing now CharacterWidth, with associated option names' change.	44

Alternate/Variant options can be assigned names.	45
New Scale options: MatchLowercase and MatchUppercase.	40
New feature HyphenChar.	41
New feature Kerning.	44
New feature PunctuationSpace.	41
New feature UprightFeatures.	38
New feature Vertical.	46
New feature WordSpace.	41
New features SmallCapsFont and SmallCapsFeatures.	38
Package options (no)config, quiet implemented.	54
\addfontfeatures: Added \ignorespaces to make it invisible.	28
Changed \fontspec call to \@fontspec so that \ignorespaces isn't called	
unnecessarily.	28
\aliasfontfeature: Implemented.	29
\aliasfontfeatureoption: Implemented.	29
\AtBeginDocument: Maths hex numbers converted to decimal.	51
Suppresses harmless maths font encoding warnings.	54
\emph: Redefined \em in order for nested emphases to work.	51
\fontspec: Added \ignorespaces to make it invisible.	26
\keyval@alias@key: Implemented.	36
\multi@alias@key: Implemented for \aliasfontfeature.	36
\newAATfeature: Replacement for \newfeaturecode.	29
\newfontscript: Implemented.	29
\newICUfeature: Implemented.	29
\zf@calc@scale: Implemented for auto-scaling options.	41
\zf@check@ot@feat: Implemented.	38
\zf@check@ot@lang: Implemented.	38
\zf@check@ot@script: Implemented.	37
\zf@DeclareFontShape: Implemented as wrapper for \DeclareFontShape.	34
Slanted/italic shape substitution implemented.	34
\zf@fontspec: Absorbed the comma into \zf@@options as to be more effi-	
cient when they are not defined.	32
Abstracted the long family name so the NFSS family is simple.	32
Incorporated \zf@get@feature@requests argument change.	32
Incorporated \zf@make@font@shapes change; removed \zf@options stor-	
age macro.	32
\zf@get@feature@requests: Absorbed comma into \zf@default@options,	_
making \zf@current@options redundant.	34
Added an argument to eliminate the \zf@options macro.	34
Removed init stuff.	34
\zf@init: Taken from \zf@get@feature@requests.	34
\zf@make@feature: Now checks for OpenType feature.	35
\zf@make@font@shapes: \zf@scale@str eliminated.	33
Absorbed \IfEqFonts.	33
Added argument for \zf@get@feature@requests change.	33
Added code for SmallCaps features.	33
Added logging of /B, /I, /BI failure.	33 33
Changed input syntax.	55
Incorporated \sidefault test into the \DeclareFontShape argument directly now that it's fully expanded	32
rectly now that it's fully expanded.	33
Made local to hide \zf@fontname changes.	33

Removed \zf@scshape macro.	33
Removed \nfss@catcodes wrapper.	33
\zf@make@smallcaps: Now uses \zf@check@ot@feat.	35
\zf@partial@fontname: Implemented.	39
\zf@update@family: Now fully expands arguments.	34
\zf@update@ff: Removed ridiculous \zf@feature@separator code.	35
\zf@v@strnum: Implemented.	37
\zf@wordspace@parse: Implemented.	41

# Index

Numbers written in italic refer to the page where the corresponding entry is described; numbers underlined refer to the code line of the definition; numbers in roman refer to the code lines where the entry is used.
